## Chapter 4: User Management and Authentication

**Overview of Avamar user accounts** ........................................................................ 62

**User authentication** .......................................................................................... 62

  * How Avamar authenticates users and assigns roles ........................................ 63

**Avamar internal authentication** .......................................................................... 63

**Directory service authentication** ... 64

  * LDAP directory service authentication .......................................................... 65
  * OpenLDAP directory service authentication .................................................... 70
  * Adding an NIS directory service .................................................................. 75
  * Error messages during directory service configuration ................................... 76
  * Adding an LDAP map ................................................................................... 77
  * Editing the role for an LDAP map ................................................................. 78
  * Deleting an LDAP map ................................................................................. 79
  * Editing the time-out value for directory service processes ......................... 79

**Enabling backward compatibility with Enterprise Authentication** .................. 80

**Roles** .................................................................................................................. 81

  * Administrator roles ...................................................................................... 81
  * Operator roles ............................................................................................... 81
  * User roles ....................................................................................................... 83

**Adding a user to a client or domain** .................................................................... 83

**Editing user information** ................................................................................... 85

**Deleting a user** .................................................................................................. 85

## Chapter 5: Backup

**Performing on-demand backups** ....................................................................... 88

  * Performing an on-demand backup of a client ............................................... 88
  * Performing an on-demand group backup ....................................................... 89

**Scheduling backups** .......................................................................................... 89

  * Datasets ........................................................................................................... 90
  * Schedules ........................................................................................................ 95
  * Retention policies ......................................................................................... 100
  * Groups ............................................................................................................ 105
  * Enabling scheduled backups ....................................................................... 113

**Monitoring backups** .......................................................................................... 114

**Canceling backups** ............................................................................................ 114

**Managing completed backups** .......................................................................... 115

  * Finding a completed backup to manage ....................................................... 115
  * Validating a backup ....................................................................................... 116
  * Changing the expiration date for a backup ................................................... 116
  * Changing the retention type for a backup ..................................................... 117
### Chapter 12  Avamar Client Manager  271

Overview of Avamar Client Manager .......................................................... 272
Connection security .............................................................................. 272
Apache web server authentication ...................................................... 272
Editing the session time-out period ................................................... 272
Increasing the JavaScript time-out period ........................................ 273
Avamar Client Manager configuration properties............................ 274
Starting Avamar Client Manager .......................................................... 275
Login page ..................................................................................... 276
Global tools ........................................................................................ 276
Adding an Avamar server................................................................. 276
Removing an Avamar server ............................................................. 277
Changing the settings for an Avamar server .................................... 277
Selecting a server ........................................................................... 278
Filters ............................................................................................. 278
Viewing details .............................................................................. 284
Exporting data ................................................................................ 284
Setting the entries per page limit ...................................................... 284
Viewing tool tips ............................................................................ 285
Overview ........................................................................................ 285
Server Summary ............................................................................. 285
Dashboard ..................................................................................... 286
Clients ............................................................................................ 289
Client and server tools ...................................................................... 289
Add Clients .................................................................................... 295
Registered Clients .......................................................................... 300
Activated Clients ............................................................................ 300
Failed Clients ................................................................................ 303
Idle Clients ..................................................................................... 304
Upgrade Clients ............................................................................. 304
Policies ........................................................................................ 307
Adding clients to a group................................................................. 307
Removing clients from a group........................................................ 308
Viewing the dataset policy of a group............................................. 308
Viewing the retention policy of a group ......................................... 308
Viewing the schedule policy of a group ......................................... 309
Queues ........................................................................................ 309
Canceling a task ............................................................................. 309
Logs ............................................................................................ 310
Viewing the client log after upgrading an Avamar client................. 311
Clearing all log entries in a section .................................................. 311

### Chapter 13  Avamar Desktop/Laptop  313

Overview of Avamar Desktop/Laptop ................................................... 314
Requirements for Avamar Desktop/Laptop ........................................ 315
Client computer requirements ........................................................ 315
Web browser requirements ............................................................. 316
Network requirements ...................................................................... 317
Avamar client software installation .................................................. 317
Supported systems management tools ............................................ 318
Push installation on Windows computers ....................................... 318
Chapter 14  Data Domain System Integration  345

Overview of Data Domain system integration .................................................. 346
Integration of Avamar with Data Domain ......................................................... 346
File system backups on a Data Domain system ............................................... 347
Application backups on a Data Domain system ............................................... 347
VMware instant access ..................................................................................... 347
Checkpoints on a Data Domain system ............................................................ 348
Data Domain system streams ......................................................................... 348
Replication with Data Domain systems ............................................................ 349
Monitoring and reporting Data Domain system status .................................... 349
Security with Data Domain system integration ................................................. 350
Data migration to a Data Domain system .......................................................... 350
Preparing to add a Data Domain system .......................................................... 350
System requirements for Data Domain system integration ............................... 350
Creating a DD Boost user account ................................................................... 352
Adding a Data Domain system ......................................................................... 353

Appendix A  Command Shell Server Logins  355

User accounts ................................................................................................. 356
Starting command shell sessions ................................................................. 356
Switching user IDs ......................................................................................... 356
Using sudo ..................................................................................................... 357
Prefixing commands with sudo ................................................................. 357
Spawning a sudo Bash subshell ................................................................. 357

As part of an effort to improve its product lines, EMC periodically releases revisions of its software and hardware. Therefore, some functions described in this document might not be supported by all versions of the software or hardware currently in use. The product release notes provide the most up-to-date information on product features. Contact your EMC technical support professional if a product does not function properly or does not function as described in this document.

Note
This document was accurate at publication time. Go to EMC Online Support (https://support.EMC.com) to ensure that you are using the latest version of this document.

Purpose
This guide describes how to configure, administer, monitor, and maintain the Avamar system.

Audience
The information in this guide is primarily intended for system administrators who are responsible for maintaining servers and clients on a network, as well as operators who monitor daily backups and storage devices.

Revision history
The following table presents the revision history of this document.

<table>
<thead>
<tr>
<th>Revision</th>

Where to get help

The Avamar support page provides access to licensing information, product documentation, advisories, and downloads, as well as how-to and troubleshooting information. This information may enable you to resolve a product issue before you contact EMC Customer Support.

To access the Avamar support page:

1. Go to [https://support.EMC.com/products](https://support.EMC.com/products).
2. Type a product name in the Find a Product box.
3. Select the product from the list that appears.
4. Click the arrow next to the Find a Product box.
5. (Optional) Add the product to the My Products list by clicking Add to my products in the top right corner of the Support by Product page.

Documentation
The Avamar product documentation provides a comprehensive set of feature overview, operational task, and technical reference information. Review the following documents in addition to product administration and user guides:

- Release notes provide an overview of new features and known limitations for a release.
- Technical notes provide technical details about specific product features, including step-by-step tasks, where necessary.
- White papers provide an in-depth technical perspective of a product or products as applied to critical business issues or requirements.

Knowledgebase
The EMC Knowledgebase contains applicable solutions that you can search for either by solution number (for example, esgxxxxxx) or by keyword.

To search the EMC Knowledgebase:
1. Click Search at the top of the page.
2. Type either the solution number or keywords in the search box.
3. (Optional) Limit the search to specific products by typing a product name in the Scope by product box and then selecting the product from the list that appears.
4. Select Knowledgebase from the Scope by resource list.
5. (Optional) Specify advanced options by clicking Advanced options and specifying values in the available fields.
6. Click Search.

Online communities
Visit EMC Community Network at http://community.EMC.com for peer contacts, conversations, and content on product support and solutions. Interactively engage online with customers, partners and certified professionals for all EMC products.

Live chat
To engage EMC Customer Support by using live interactive chat, click Join Live Chat on the Service Center panel of the Avamar support page.

Service Requests
For in-depth help from EMC Customer Support, submit a service request by clicking Create Service Requests on the Service Center panel of the Avamar support page.

Note
To open a service request, you must have a valid support agreement. Contact your EMC sales representative for details about obtaining a valid support agreement or with questions about your account.

To review an open service request, click the Service Center link on the Service Center panel, and then click View and manage service requests.

Facilitating support
EMC recommends that you enable ConnectEMC and Email Home on all Avamar systems:
• ConnectEMC automatically generates service requests for high priority events.
• Email Home emails configuration, capacity, and general system information to EMC Customer Support.

Your comments
Your suggestions will help us continue to improve the accuracy, organization, and overall quality of the user publications. Send your opinions of this document to DPAD.Doc.Feedback@emc.com.

Please include the following information:
• Product name and version
• Document name, part number, and revision (for example, 01)
• Page numbers
• Other details that will help us address the documentation issue
CHAPTER 1

Introduction

This chapter includes the following topics:

- EMC Avamar system overview .......................................................... 22
- Data deduplication .............................................................................. 28
- Security and networking ..................................................................... 29
EMC Avamar system overview

An EMC® Avamar® system is a client/server network backup and restore solution. An Avamar system consists of one or more Avamar servers and the network servers or desktop clients that back up data to those servers. The Avamar system provides centralized management through the Avamar Administrator graphical management console software application.

Avamar server

Avamar is a hard disk based IP network backup and restore solution. Avamar servers use internal hard disk storage. An Avamar server is a logical grouping of one or more nodes that is used to store and manage client backups.

Hardware manufacturers typically call their equipment servers (for instance, the Dell PowerEdge 2950 server). In the context of an Avamar system, this equipment is called a node. An Avamar node is a self-contained, rack-mountable, network-addressable computer that runs Avamar server software on the Linux operating system.

Avamar ensures fault tolerance by managing disk drive space in units of space called stripes.

In the Avamar system, an object is a single instance of deduplicated data. Each Avamar object inherently has a unique ID. Objects are stored and managed within stripes on the Avamar server.

Figure 1  Avamar server nodes, stripes, and objects
All Avamar servers store client backups and also provide essential processes and services that are required for client access and remote system administration.

Avamar servers are available in either single-node or scalable multi-node configurations. For the most part, when using Avamar Administrator management console software, all Avamar servers look and behave the same. The main differences among Avamar server configurations are the number of nodes and disk drives reported in the server monitor.

Documenting specific differences in Avamar server hardware configurations is beyond the scope of this guide. Whenever specific limitations and best practices for certain configurations are known, they are noted. However, these occasional notes should not be considered definitive or exhaustive. Consult an EMC sales representative or an EMC reseller for more information about specific hardware.

Nodes

The primary building block in any Avamar server is a node. Each node is a self-contained, rack-mountable, network-addressable computer that runs Avamar server software on the Linux operating system.

Nodes can also contain internal storage in the form of hard disk drives. If the node is configured with internal storage (that is, a single-node server), it is internally mirrored to provide robust fault tolerance.

There are three types of nodes.

Utility node
A utility node is dedicated to scheduling and managing background Avamar server jobs. In scalable multi-node Avamar servers, a single utility node provides essential internal services for the server:

- Management Console Server (MCS)
- cronjob
- External authentication
- Network Time Protocol (NTP)
- Web access

Because utility nodes are dedicated to running these essential services on multi-node Avamar servers, they cannot be used to store backups. Single-node Avamar servers combine all of the features and functions of utility and storage nodes on a single node.

Storage nodes
Storage nodes are nodes that store backup data. Multiple storage nodes are configured with multi-node Avamar servers based upon performance and capacity requirements. You can add storage nodes to an Avamar server over time to expand performance with no downtime.

Avamar clients connect directly with Avamar storage nodes. Client connections and data are load balanced across storage nodes.

NDMP Accelerator
An NDMP Accelerator node is a specialized node that uses NDMP to provide data protection for certain NAS devices, including the EMC Celerra® IP storage systems and Network Appliance filers.

Avamar server functional blocks

The major Avamar server functional blocks include the data server, Management Console Server (MCS), and the EM Tomcat server (EMT). The following figure illustrates the interaction of these components within the server and with other Avamar components.
Data server
When performing a backup, restore, or validation, Avamar backup clients communicate directly with the data server. All scheduled backups are initiated by the MCS scheduler.

Management Console Server (MCS)
The Management Console Server (MCS) provides centralized administration (scheduling, monitoring, and management) for the Avamar server. The MCS also runs the server-side processes used by the Avamar Administrator graphical management console.

The following table provides details on the functions that the MCS provides.

### Table 3 MCS functions

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Client registry</td>
<td>Controls client registration and activation.</td>
</tr>
<tr>
<td>Account management</td>
<td>Used to create and manage domains, clients, users, and groups.</td>
</tr>
<tr>
<td>Reporting</td>
<td>Used to create and export system reports. The <em>EMC Avamar Reports Guide</em> provides more information.</td>
</tr>
<tr>
<td>Events</td>
<td>Displays system events and activities.</td>
</tr>
<tr>
<td>Scheduler/dispatcher</td>
<td>Controls when backup and restore operations occur, or if the operations can be queued for processing.</td>
</tr>
<tr>
<td>PostgreSQL database</td>
<td>Stores Avamar server data. PostgreSQL is an open architecture database management system. Information in the MCS database is accessible through any PostgreSQL-compliant ODBC interface. The MCS database filename is mcdb, and it is located on the utility node in the /usr/local/avamar/var/mc/server_data/postgres directory. The MCS database</td>
</tr>
</tbody>
</table>
Table 3 MCS functions (continued)

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>contents are fully backed up on the Avamar server and can be restored if the MCS fails.</td>
</tr>
<tr>
<td></td>
<td><strong>NOTICE</strong> The MCS database is intended for read-only access for reporting or query purposes. Do not manually modify any data in mcdb tables unless instructed to do so by EMC Customer Support. Directly modifying MCS operational data can cause loss of referential integrity, which could result in irretrievable loss of data.</td>
</tr>
</tbody>
</table>

**EM Tomcat server (EMT)**

The Avamar EM Tomcat server (EMT) provides essential services that are required to display, and work with, Avamar server information.

The EMT also communicates directly with MCS. This communication is a required part of all Avamar systems.

**Avamar clients**

Avamar provides client software for various computing platforms. Each client comprises a client agent and one or more plug-ins.

**Figure 3** Avamar client agent and plug-ins

**Agents**

Avamar agents are platform-specific software processes that run on the client and communicate with the Management Console Server (MCS) and any plug-ins installed on that client.

**Plug-ins**

There are two types of Avamar plug-ins:

- File system plug-ins are used to browse, back up, and restore files or directories on a specific client file system.
- Application plug-ins support backup and restore of databases or other special applications.

The following table lists the file system and application plug-ins that Avamar supports.
### Table 4 Supported plug-ins

<table>
<thead>
<tr>
<th>Type of plug-in</th>

Client compatibility requirements are available in the *EMC Avamar Compatibility and Interoperability Matrix* on EMC Online Support at [https://support.EMC.com](https://support.EMC.com). The requirements in the matrix include supported operating systems and application versions.

The Avamar file system client and the plug-ins that you install on the host must have the same version number.

### User interfaces

Several user interfaces are available in the Avamar system to enable management and monitoring.

**Avamar Administrator**

Avamar Administrator is a graphical management console software application that is used to administer an Avamar system from a supported Windows client computer.
EMC Backup & Recovery Manager
Backup & Recovery Manager manages all Avamar systems in the enterprise. Backup & Recovery Manager also has an integrated user interface to manage the enterprise's NetWorker servers and Data Domain backup targets.

The following table lists some of the enterprise management capabilities of Backup & Recovery Manager. The table does not include additional features in Backup & Recovery Manager that are specific to NetWorker servers and to Data Domain backup targets.

**Table 5 Avamar system management features of Backup & Recovery Manager**

<table>
<thead>
<tr>
<th>Feature</th>
<th>Backup &amp; Recovery Manager</th>
</tr>
</thead>
<tbody>
<tr>
<td>Software host</td>
<td>VMware vSphere client</td>
</tr>
<tr>
<td>At-a-glance dashboard</td>
<td>Select between consolidated and individual status views of Avamar systems, NetWorker servers, and Data Domain systems</td>
</tr>
<tr>
<td>Detailed backup and capacity information for Avamar systems</td>
<td>Yes</td>
</tr>
<tr>
<td>Monitor backups</td>
<td>Yes, through an Activity Monitor screen. Use the Activity Monitor screen to view backup and replication details, and to start, stop, and restart tasks.</td>
</tr>
<tr>
<td>Replication management</td>
<td>Yes</td>
</tr>
<tr>
<td>Launch other management applications</td>
<td>• Avamar Administrator</td>
</tr>
<tr>
<td></td>
<td>• Avamar Client Manager</td>
</tr>
<tr>

<td>• Avamar Installation Manager</td>
</tr>
<tr>
<td></td>
<td>• AvInstaller service</td>
</tr>
<tr>
<td>Display warnings, errors, and system alerts</td>
<td>Yes, in a quick-look graphical display and in detailed text. Filter the view by product, system, and category.</td>
</tr>
<tr>
<td>Management reports: select, view, and export</td>
<td>• Backup</td>
</tr>
<tr>
<td></td>
<td>• System</td>
</tr>
<tr>
<td></td>
<td>• Configuration</td>
</tr>
</tbody>
</table>

The Backup & Recovery Manager product documentation provides complete details on the user interface.

**Avamar Client Manager**
Avamar Client Manager is a web-based management application that provides centralized Avamar client administration capabilities for larger businesses and enterprises. Avamar Client Manager helps with the management of large numbers of Avamar clients.

Avamar Client Manager works with Avamar clients on a supported native operating system and Avamar clients on a supported operating system running in a VMware virtual machine. Avamar Client Manager cannot work with Avamar clients through virtual center, virtual machine, or virtual proxy configurations. The Avamar Client Manager UI displays supported Avamar clients and hides all unsupported clients.

**Avamar Desktop/Laptop**
Avamar Desktop/Laptop is a version of the Avamar client software that adds enhanced features for enterprise desktop and laptop computers.
The Avamar Desktop/Laptop features are designed to improve the functionality of Avamar client for Windows and Macintosh desktops and laptops. Many of the features are also supported on qualifying Linux computers.

Avamar Desktop/Laptop functionality is available through two user interfaces:

- The client local user interface (client UI) is installed on the client computer when you install either the Avamar Client for Windows or the Avamar Client for Mac OS X. With the client UI, an Avamar icon appears in the notification area ("system tray") on Windows computers or on the menu bar on Mac computers. Right-click the icon on Windows or click the icon on Mac to open the client menu, which provides access to backup, restore, program settings, and logs.

- Use the web browser user interface (web UI) to start an on-demand backup or restore, view backup and restore activity for a client computer, or configure other backup settings for a client computer.

**Avamar Installation Manager**

The Avamar Installation Manager user interface is part of the AvInstaller software that EMC Customer Support installs on the utility node during an Avamar server software installation or upgrade. Use the Avamar Installation Manager to install and upgrade software on the Avamar server.

**Avamar Downloader Service**

The Avamar Downloader Service manages the process of checking for and downloading Avamar server software updates. The Avamar Downloader Service software runs on a stand-alone Microsoft Windows server that allows network access to EMC sites on the Internet and to all Avamar servers at a site.

**Avamar Web Restore**

Avamar Web Restore provides access to the following functionality:

- Search for or browse backed up directories and files to restore.
- Download Avamar client software.
- View Avamar product documentation that is stored on the Avamar server.

**Data Domain system support**

You can store backups on either the Avamar server or an EMC Data Domain® system. Backup metadata is stored on the Avamar server.

Before you can store backups on a Data Domain system, you must add the Data Domain system to the Avamar configuration by using Avamar Administrator. Then you select the Data Domain system in the plug-in options when you perform an on-demand backup or when you create a dataset for a scheduled backup. You can also use the command line interface (CLI) to perform backups to a Data Domain system.

The steps to restore backups are the same whether you restore from the Avamar server or a Data Domain system. The restore process determines the location of the backup and restores the backup.

**Data deduplication**

Data deduplication is a key feature of the Avamar system. Data deduplication ensures that each unique sub-file, variable length object is stored only once across sites and servers.

During backups, Avamar client software examines the client file system and applies a data deduplication algorithm that identifies redundant data sequences and breaks the
client file system into sub-file, variable length data segments. Each data segment is assigned a unique ID.

The client software then determines whether this unique ID has already been stored on the Avamar server. If this object resides on the Avamar server, a link to the stored object is referenced in the backup.

Once an object has been stored on the server, it is not sent over the network again, no matter how many times it is encountered on any number of clients. This feature significantly reduces network traffic and provides for greatly enhanced storage efficiency on the server.

Figure 4  Data deduplication

1. Break data into atoms (variable length segments of file data).
2. Send and store each atom only once.
3. Up to 500 times daily data reduction in the Avamar backup repository.

Security and networking

The following sections provide an overview of key Avamar security and networking features. The EMC Avamar Product Security Guide provides full details on product security and network configuration.

Encryption

Avamar can encrypt all data sent between clients and the server “in flight.”

To provide enhanced security during client/server data transfers, Avamar supports two levels of “in-flight” encryption: medium and high.

You can set the encryption level on a client-by-client basis in client properties, or for an entire group of clients in group properties. You also can disable “in-flight” encryption entirely.

Each individual Avamar server can also be configured to encrypt data stored on the server “at rest.” The decision to encrypt all data stored in an Avamar server is typically a one-time decision that is made when the server is initially deployed at a customer site.
IPv4 and IPv6 support

Internet Protocol (IP) is a set of communication rules for routing traffic across networks to addressable devices like Avamar system components. The Avamar system supports both Internet Protocol Version 4 (IPv4) and IPv6 address notation.

IPv4 notation
IPv4 notation is displayed as four octets, that is 1- to 3-digit base 10 numbers in a range of 0 to 255. Each octet is separated by periods and represents 8 bits of data for a total address space of 32 bits.

A subnet mask identifies a range (a subnet) of IP addresses on the same network. For Avamar purposes, the subnet mask is /24, representative of a 255.255.255.0 netmask.

An example IPv4 address and subnet mask is `10.99.99.99/24`.

IPv4 notation cannot be abbreviated. If an octet has zero (0) value, use a 0 in that octet.

IPv6 notation
IPv6 notation is displayed as 16 octets, that is 2-digit hexadecimal (base 16) numbers in a range of 00 to FF. IPv6 notation combines octets by pairs into eight groups that are separated by colons, each group representing 16 bits of data for a total address space of 128 bits.

For Avamar purposes, the subnet mask (called prefix in IPv6) is /64.

An example IPv6 address and prefix is `2001:0db8:85a3:0042:1000:8a2e:0370:7334/64`.

As for a group with zero (0) value, IPv6 notation is different from IPv4 in that it can be abbreviated. For example, the following is a valid IPv6 address and prefix:
`2001:db8:abcd:0012::0/64`.

Avamar IP configurations
In the Avamar user interface, an IP address may be displayed in either IPv4 or IPv6 notation. The displayed value depends on how that particular component was configured when the hardware and software were installed.

IPv4 and IPv6 are not interoperable. They operate in separate stacks (that is, parallel, independent networks).

Avamar can be set up in a dual stack configuration. In that case, each Avamar component may have an IPv4 address, an IPv6 address, or both (one primary and the other secondary). The Avamar user interface may display a component’s primary address or both dual stack addresses. For example, the following IP address for a particular device indicates that it is configured as dual stack: `10.99.99.99/24, 2001:db8:abcd:0012::0/64`. 
CHAPTER 2
Avamar Administrator

This chapter includes the following topics:

- Overview of Avamar Administrator ................................................................. 32
- Installing Avamar Administrator ...................................................................... 32
- Upgrading Avamar Administrator .................................................................... 34
- Uninstalling Avamar Administrator ................................................................ 34
- Editing Avamar Administrator client preferences ........................................... 35
- Setting a session time-out for Avamar Administrator ........................................ 35
- Starting Avamar Administrator ......................................................................... 36
- Avamar Administrator dashboard .................................................................... 37
- Avamar Administrator user interface elements ................................................ 42
Overview of Avamar Administrator

Avamar Administrator is a graphical management console software application that is used to administer an Avamar system from a supported Windows or Linux client computer.

Install Avamar Administrator on a supported computer and launch the software from the desktop icon or a command shell, or launch the Java Web Start version of the console software from a web browser or from Backup & Recovery Manager.

Avamar Administrator is the primary user interface for monitoring and configuring the Avamar system. Use it to monitor backup, restore, and system maintenance activities, as well as to configure backup policies, manage clients and user accounts, and configure other system settings.

You can administer one Avamar system at a time from Avamar Administrator.

The Avamar Administrator dashboard appears when you log in to Avamar Administrator. The dashboard provides an at-a-glance view of Avamar system status, as well as access to all functionality through menus and launcher buttons.

Installing Avamar Administrator

You can install Avamar Administrator on supported Microsoft Windows and 64-bit Linux platforms.

Details on support for specific operating system versions is available in the EMC Avamar Compatibility and Interoperability Matrix on EMC Online Support at https://support.EMC.com.

Installing Avamar Administrator on Microsoft Windows

Procedure
1. Log in to the computer on which you are installing Avamar Administrator.
2. Open a web browser and type the following URL:

   http://Avamar_server

   where Avamar_server is the DNS name or IP address of the Avamar server.

   The EMC Avamar Web Restore page appears.
3. Click Downloads.
4. Click + next to the Windows (32 bit) folder.
5. Click + next to the Microsoft Windows Vista, 7, 8, 8.1, Microsoft Windows Server 2008 folder.
6. Locate the Java Runtime Environment (JRE) install package, which is typically the last entry in the folder.
7. If the JRE on the client computer is older than the JRE hosted on the Avamar server, download and install the newer JRE from the Avamar server:
   a. Click the jre-version-windows-i586-p install package, where version is the JRE version.
   b. Open the installation file, or download the file and then open it from the saved location.
c. Follow the onscreen instructions to complete the JRE installation.

8. Click the `AvamarConsoleMultiple-windows-x86-version.exe` install package, where `version` is the Avamar Administrator software version.

Avamar Administrator is only available as a 32-bit application. However, it will also run on 64-bit Windows computers.

9. Open the installation file, or download the file and then open it from the saved location.

10. Follow the onscreen instructions to complete the Avamar Administrator software installation.

# Installing Avamar Administrator on Linux

**Procedure**

1. Log in to the computer on which you are installing Avamar Administrator.

2. Open a web browser and type the following URL:
   
   ```
   http://Avamar_server
   ```
   
   where `Avamar_server` is the DNS name or IP address of the Avamar server.

   The EMC Avamar Web Restore page appears.

3. Click Downloads.

4. Click + next to the Linux for x86 (64 bit) folder.

5. Click + next to the Red Hat Enterprise Linux 4 folder.

6. Locate the JRE RPM install package, which is typically the last entry in the folder.

7. If the JRE on the client computer is older than the JRE hosted on the Avamar server, then download the install package to a temporary folder such as `/tmp`.

   The install package filename is `jre-version-platform.rpm`, where `version` is the JRE version and `platform` is the computing platform.

8. Download the `AvamarConsole-linux-rhel4-x86_64-version.rpm` install package to a temporary install folder such as `/tmp`.

   Use the Red Hat Enterprise Linux 4 install packages for all supported Linux versions.

9. Open a command shell and log in as root on the computer where the software will be installed.

10. Change directory to the temporary folder to which you downloaded the install packages by typing a command such as `cd /tmp`.

11. If you downloaded a JRE, install it by typing `rpm -ivh jre-version-platform.rpm`.

12. Follow the onscreen instructions to complete the JRE installation.

13. Install Avamar Administrator by typing `rpm -ih AvamarConsole-linux-rhel4-x86_64-version.rpm`

   The install process prompts you to run `avsetup_mcc` to configure Avamar Administrator.

   The configuration process prompts you to specify the location of the JRE installation.
15. Press Enter to accept the default install location.
   The configuration process prompts you to specify the root directory of the Avamar software.
16. Press Enter to accept the default install location.
   A confirmation message appears.

### Upgrading Avamar Administrator

You can upgrade Avamar Administrator on either Microsoft Windows or Linux computers.

**Procedure**

- You can install multiple versions of Avamar Administrator on the same Microsoft Windows computer. If you install Avamar Administrator on a computer where it is already installed, select a destination folder carefully during the installation procedure:
  - To keep an older version, select a different installation folder.
  - To directly upgrade the Avamar Administrator installation, select the same installation folder. The two versions are identified by their full version numbers.
- To upgrade the Avamar Administrator software on the Linux platform, uninstall the previous version and install the new software. Use of the Linux software upgrade command (`rpm -Uh`) is not supported.

### Uninstalling Avamar Administrator

You can uninstall Avamar Administrator from either a Microsoft Windows or a Linux computer.

**Before you begin**

Close any open Avamar Administrator sessions. Otherwise, the uninstall process may not complete successfully, which can complicate future installation of Avamar Administrator.

**Procedure**

- On a Microsoft Windows computer, open the Windows Start menu and select Programs > EMC Avamar > Administrator > version > Uninstall, and then click OK on the confirmation message.
- On a Linux computer:
  1. Open a command shell and log in as root.
  2. Determine the package name by typing `rpm -qa | grep Av`.
  3. Type `rpm -e AvamarConsole-version`, where `AvamarConsole-version` is the Avamar Administrator install package.
Editing Avamar Administrator client preferences

You can edit some Avamar Administrator client preferences directly in Avamar Administrator. However, a number of preferences are only available for editing in the mcclient.xml client preferences file.

Procedure
1. Close Avamar Administrator.
2. Open install_dir/var/mc/gui_data/prefs/mcclient.xml in a text editor, where install_dir is the Avamar Administrator installation directory.
3. Edit the preference elements.
4. Save and close the file.

The changes take effect the next time that you start Avamar Administrator.

Setting a session time-out for Avamar Administrator

An Avamar Administrator session remains active until a user closes the application by choosing Exit from the menu. To protect the assets available through Avamar Administrator, set a session time-out value. The value applies to all Avamar Administrator sessions connected to the Avamar server.

After you set a session time-out value, Avamar Administrator monitors the UI for activity. When Avamar Administrator detects no mouse or keyboard activity within the UI for the number of minutes set in the time-out value, it shuts down all processes, closes all windows, and displays the Inactive dialog box.

Procedure
1. Open a command shell and log in by using one of the following methods:
   • For a single-node server, log in to the server as admin.
   • For a multi-node server:
     a. Log in to the utility node as admin.
     b. Load the admin OpenSSH key by typing:
        
        ```bash
        ssh-agent bash
        ssh-add ~admin/.ssh/admin_key
        ```
     c. When prompted, type the admin_key passphrase and press Enter.
2. Stop the Management Console Server (mcs) service by typing dpnctl stop mcs.
4. Open mcserver.xml in a plain text editor.
5. Find the <node name="mon"> entry.
6. Edit the value of the <entry key="consoleInactiveMinutesToReport" value="n" /> entry within the <node name="mon"> entry, where n is the session time-out value in minutes.
7. Save the change and close the text editor.
8. Start the MCS and the scheduler by typing:
Starting Avamar Administrator

Start Avamar Administrator by using the console software that is installed on a local computer or start Avamar Administrator by using the Java Web Start version of the console software.

**Before you begin**

Ensure that a minimum of 512 MB of system RAM is available on the local computer. Otherwise, Java heap errors may occur when you start Avamar Administrator.

**Procedure**

1. Launch Avamar Administrator by using one of the following methods.

<table>
<thead>
<tr>
<th>Console software version</th>
<th>Method</th>
</tr>
</thead>
<tbody>
<tr>
<td>Microsoft Windows</td>
<td>Double-click the Avamar Administrator icon on the Windows desktop.</td>
</tr>
<tr>
<td>Linux</td>
<td>Open a command shell, and type mcgui.</td>
</tr>
<tr>
<td>Java Web Start</td>
<td>Type http://Avamar_server/mcgui in the web address field of a web browser, where Avamar_server is the IP address or resolvable hostname of an Avamar server.</td>
</tr>
<tr>
<td>Java Web Start version from Backup &amp; Recovery Manager</td>
<td>In Backup &amp; Recovery Manager, on the Systems window, select an Avamar system and click Launch Management Console.</td>
</tr>
</tbody>
</table>

The Log On window appears.

2. In **User Name**, type a username.

   To access all Avamar Administrator functionality, the account that is associated with this username must be assigned the role of Administrator. Other roles provide reduced functionality.

   To authenticate by using the internal authentication system, type only a username. To authenticate by using the enterprise authentication system (deprecated) or directory service authentication, type `username@server`, where `username` is the username and `server` is the fully qualified domain name of the authentication server.

   If you use the format `username@server` for the username, then the system tries to authenticate the user by using enterprise authentication. If authentication with enterprise authentication fails, then the system tries to authenticate the user by using directory service authentication.

3. In **Password**, type the password for the user account.

4. In **Domain Name**, type the Avamar domain to log in to:
   - To log in to the root domain, use the default entry of a single slash (/) character.
To log in to a specific domain or subdomain, type the domain path by using the syntax /domain/subdomain1/subdomain2.

5. In Administrator Server, type the IP address or DNS name of the Avamar server to log in to.

**Note**

Automatically supply the Administrator Server and Domain Name boxes with an Avamar server name and an Avamar domain by clicking Options and typing the server name in Default Administrator Server and the domain name in Default Domain.

6. Click Log On.

The Avamar Administrator dashboard appears.

**Avamar Administrator dashboard**

The Avamar Administrator dashboard provides an at-a-glance view of Avamar system status, as well as access to all functionality through menus and launcher buttons.

The dashboard appears when you log in to Avamar Administrator.

**Figure 5** Avamar Administrator dashboard

**Launcher buttons**

The dashboard launcher buttons invoke persistent windows to perform tasks in Avamar Administrator.

**Table 6** Dashboard launcher buttons

<table>

**System Information panel**

The **System Information** panel on the Avamar Administrator dashboard provides an overview of important system statistics.

**System State**

The **System State** icon provides a status indicator for overall system status:

- A green checkmark icon indicates that the system is fully operational.
- A yellow caution icon indicates that there is an issue with the system that requires attention, but backups can continue.
- A red x icon indicates that there is a problem with the system that requires immediate attention. Backups cannot occur until you resolve the problem.

Click the arrow icon next to the **System State** field to view more detailed system state information. The following table provides details about system state information in the dashboard.

**Table 7 System State fields on the Avamar Administrator dashboard**

</tr>
</tbody>
</table>
Scheduler State
The Scheduler State field indicates whether scheduled activities are running or suspended. Scheduled activities include backups, email notifications, and replications. If scheduled activities are running, then the activities will occur at the scheduled time. If scheduled activities are suspended, then the activities will not occur until you resume the activities.

Click Suspend or Resume to suspend or resume scheduled activities.

Maintenance Activities State
The Maintenance Activities State field indicates whether maintenance activities are running or suspended. Maintenance activities include checkpoints, checkpoint validation, and garbage collection. If maintenance activities are running, then the activities will occur at the scheduled time. If maintenance activities are suspended, then the activities will not occur until you resume the activities from the Server window.

License Expiration
The License Expiration field lists the calendar date on which the license for the Avamar server expires.

Data Protected
The Data Protected field lists the total amount of client data protected (in bytes).

Data Protected in last 24 hours
The Data Protected in last 24 hours field lists the total amount of client data protected (in bytes) during the past 24 hours.

Activities panel

The Activities panel in the Avamar Administrator dashboard provides status and detailed information for backup and replication jobs.

Backup Jobs
The main status icon for backup jobs in the Activities panel indicates whether scheduled backups occur at the scheduled time or if there is a problem that is preventing scheduled backups from occurring.

Click the arrow button next to the Backup Jobs field to display detailed status information. The following table provides details on the status information available for backup jobs.

Table 8 Backup job fields in the Avamar Administrator dashboard

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Scheduler State</td>
<td>Specifies whether the scheduler for activities such as backups, email</td>
</tr>
<tr>
<td></td>
<td>notifications, and replications is running or suspended.</td>
</tr>
<tr>
<td>Dispatcher State</td>
<td>Specifies whether the dispatcher is running or suspended. If the dispatcher</td>
</tr>
<tr>
<td></td>
<td>is suspended, then the Avamar server has reached the health check limit</td>
</tr>
<tr>
<td></td>
<td>and no backups can occur. Capacity limits and thresholds on page 218</td>
</tr>
<tr>
<td></td>
<td>provides details.</td>
</tr>
<tr>
<td>Backup Groups</td>
<td>Specifies the number of backup groups that are enabled. Click the window</td>
</tr>
<tr>
<td>Enabled</td>
<td>icon to the right of the field to open the Policy window and manage groups.</td>
</tr>
</tbody>
</table>

You can also view the total number of backup jobs that:

- Are pending.
• Are currently running.
• Failed within the specified period.
• Succeeded with exceptions within the specified period.
• Succeeded within the specified period.
Select a value from the **Period** list to control the period for the results of completed backups.

Click a numeric button to view detailed information for a backup job in the **Activity Monitor**.

**Replication Jobs**
The main status icon for replication jobs in the **Activities** panel indicates whether replication jobs occur:

• A green check mark icon indicates that scheduled replication jobs occur at the scheduled time.
• A yellow caution icon indicates that one or more replication groups are disabled.
• A red x icon indicates that scheduled replication jobs are blocked. The block might be due to the scheduler being in a suspended state, all replication groups being disabled, or some other issue with the system.

Click the window icon to the right of the icon to configure replication groups in the **Replication** window.

You can also view the total number of replication jobs that:

• Are pending.
• Are currently running.
• Failed within the specified period.
• Succeeded with exceptions within the specified period.
• Succeeded within the specified period.
Select a value from the **Period** list to control the period for the results of completed replication jobs.

Click a numeric button to view detailed information for a replication job in the **Replication Report**.

**Capacity panel**

The **Capacity** panel on the Avamar Administrator dashboard provides system capacity usage information for the Avamar server and any Data Domain systems that have been added.

**Avamar server capacity information**
The capacity usage of the Avamar server is shown as a vertical bar with color indicators for usage levels that are based on the percentage of total capacity. A text field lists the percentage of used capacity.

If the Avamar system configuration includes a Data Domain system, then Avamar server capacity calculations include metadata usage for the Data Domain system.

Click the link on the Avamar server name to view detailed system information in the **Server Monitor**, including Data Domain metadata utilization, if applicable.

**Data Domain system capacity information**
Each configured Data Domain system is listed separately in the **Capacity** panel.
The capacity usage of the Data Domain system is shown as a vertical bar with color indicators for usage levels that are based on the percentage of total capacity. Text fields list the total capacity of the Data Domain system in gibibytes (GiB), the amount of used capacity as a percentage and value in GiB, and the total amount of available capacity in GiB. Click the link on the Data Domain system name to view the Data Domain Enterprise Manager web page for that system.

Critical Events panel

The Critical Events panel in the Avamar Administrator dashboard shows the number of unacknowledged serious system errors and warnings that have occurred, as well as certain defined system alerts.

To clear these serious system errors and warnings (that is, reset the count to zero), you must explicitly acknowledge them. Acknowledging system events on page 198 provides details.

The following table lists the system alerts that may appear in the Critical Events panel.

Table 9 System alerts in the Critical Events panel

<table>
<thead>
<tr>
<th>Type of alert</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>HFS check failures</td>
<td>If the last checkpoint validation failed, then a data integrity alert is generated. Investigate and address the issue as soon as possible. Creating a checkpoint on page 159 provides more information.</td>
</tr>
<tr>
<td>Capacity warnings</td>
<td>These alerts warn that the system is approaching critical system storage capacity usage thresholds.</td>
</tr>
<tr>
<td>Capacity usage warnings</td>
<td>These alerts warn that the system is approaching critical system storage capacity forecasting thresholds.</td>
</tr>
</tbody>
</table>

Avamar Administrator user interface elements

All of the primary windows in the Avamar Administrator user interface share several elements and functionality in common, including the status bar, navigation tree features, and mouse shortcuts.

Status bar

The status bar at the bottom of each Avamar Administrator persistent window conveys status information and provides a single-click shortcut to specific features and functions.

Figure 6 Avamar Administrator status bar

Launcher shortcuts

The shortcut icons on the left side of the status bar provide shortcuts to the six main Avamar Administrator windows.

The following table lists the shortcut icons that are available on the status bar.
Table 10 Launcher shortcut icons on the status bar

<table>
<thead>
<tr>
<th>Button</th>

<td>Configure policy-based replication.</td>
</tr>
</tbody>
</table>

Status messages

The right side of the status bar shows status messages for scheduler and backup dispatching, unacknowledged events, and the Avamar server and Data Domain systems.

Scheduler and backup dispatching status
The scheduler controls whether scheduled backups occur. The backup dispatching status indicates whether backups can occur based on whether the health check limit has been reached. The following table lists the available status messages.

Table 11 Scheduler and backup dispatching status messages

<table>
<thead>
<tr>
<th>Status message</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sch/Disp: Running/Running</td>
<td>Backups will occur at the scheduled time. Scheduled backups are enabled, and the health check limit has not been reached.</td>
</tr>
<tr>
<td>Sch/Disp: Running/Suspended</td>
<td>Even though scheduled backups are enabled, backups will not occur at the scheduled time because the health check limit has been reached. Resolve the system capacity issues and acknowledge the system event to resume backups. Capacity Management on page 217 and Acknowledging system events on page 198 provide details.</td>
</tr>
<tr>
<td>Sch/Disp: Suspended/Running</td>
<td>Even though the health check limit has not been reached, backups will not occur at the scheduled time because scheduled backups are disabled. Backups can resume when you resume scheduled operations.</td>
</tr>
<tr>
<td>Sch/Disp: Suspended/Suspended</td>
<td>Backups will not occur at the scheduled time because scheduled backups are disabled and the health check limit has been reached. Suspending and resuming scheduled operations on page 151 Suspending and resuming scheduled operations on page 151 provides details on reenabling the scheduler. Capacity Management on page 217 and Acknowledging system events on page 198 provide details on resolving the system capacity issues and acknowledging system events in order to resume scheduled backups.</td>
</tr>
</tbody>
</table>
Unacknowledged events

Certain system events to require acknowledgement by an Avamar server administrator each time they occur. The following table lists the available status messages.

Table 12 Status messages for unacknowledged events

<table>
<thead>
<tr>
<th>Status message</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Have Unacknowledged</td>
<td>There are entries in the unacknowledged events list that must be explicitly acknowledged by an Avamar server administrator. Click the Unacknowledged Events status icon or text label to show the Administration window Unacknowledged Events pane (tab). Acknowledging system events on page 198 provides details.</td>
</tr>
<tr>
<td>No Unacknowledged</td>
<td>There are no entries in the unacknowledged events list.</td>
</tr>
</tbody>
</table>

Avamar server and Data Domain system status

This icon lists the operational status of either the Avamar server or any configured Data Domain systems. The following table lists the available status messages.

Table 13 Operational status messages for Avamar or Data Domain

<table>
<thead>
<tr>
<th>Status message</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Server: Full Access</td>
<td>Normal operational state for an Avamar server. All operations are allowed.</td>
</tr>
<tr>
<td>Server: Admin</td>
<td>The Avamar server is in an administrative state in which the Avamar server and root user can read and write data; other users are only allowed to read data.</td>
</tr>
<tr>
<td>Server: Admin Only</td>
<td>The Avamar server is in an administrative state in which the Avamar server or root user can read or write data; other users are not allowed access.</td>
</tr>
<tr>
<td>Server: Admin Read Only</td>
<td>The Avamar server is in an administrative read-only state in which the Avamar server or root user can read data; other users are not allowed access.</td>
</tr>
<tr>
<td>Server: Degraded</td>
<td>The Avamar server has experienced a disk failure on one or more nodes. All operations are allowed, but immediate action should be taken to fix the problem.</td>
</tr>
<tr>
<td>Server: Inactive</td>
<td>Avamar Administrator was unable to communicate with the Avamar server.</td>
</tr>
<tr>
<td>Server: Node Offline</td>
<td>One or more Avamar server nodes are in an OFFLINE state.</td>
</tr>
<tr>
<td>Server: Read Only</td>
<td>The Avamar server is in a read-only administrative state in which all users can read data, but writing data is not allowed.</td>
</tr>
<tr>
<td>Server: Suspended</td>
<td>Avamar Administrator was able to communicate with the Avamar server, but normal operations have been temporarily suspended.</td>
</tr>
<tr>
<td>Server: Synchronizing</td>
<td>The Avamar server is in a transitional state. It is normal for the server to be in this state during startup and for short periods of time during maintenance operations.</td>
</tr>
<tr>
<td>Server: Unknown State</td>
<td>Avamar Administrator could not determine the Avamar server state.</td>
</tr>
</tbody>
</table>
Table 13 Operational status messages for Avamar or Data Domain (continued)

<table>
<thead>
<tr>
<th>Status message</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Data Domain System</td>
<td>Avamar can connect to a Data Domain system, but there is a problem with the connection.</td>
</tr>
<tr>
<td>Unresponsive</td>
<td>Avamar can connect to a Data Domain system, but there is a problem with the connection.</td>
</tr>
<tr>
<td>DD System: Inactive</td>
<td>Avamar cannot connect to a Data Domain system.</td>
</tr>
</tbody>
</table>

To suspend or resume Avamar server activities, click the Server status icon or text label to display the Avamar Server window Session Monitor tab. From there, select Actions > Resume Backups/Restores or Actions > Suspend Backups/Restores to resume or suspend server activities, respectively.

To view additional details about Data Domain system status, open the Server window by clicking Navigation > Server. Select the Server Management tab, and then select the Data Domain system in the tree. The Monitoring Status of the Data Domain system appears in the right pane. The EMC Avamar and EMC Data Domain System Integration Guide provides details on the available detailed status messages.

Navigation tree features

The navigation trees in the Administration, Backup, Restore and Manage, and Replication windows provide several controls to facilitate the location of one or more clients.

Figure 7 Navigation tree features

The upper pane shows the Avamar server domain structure. The lower pane shows contents of any domain selected in the upper pane. You can click the split pane icon to the left of the filter field between the two panes to split the two panes vertically instead of horizontally.

Click the double folder icon to the left of the filter field to show all clients in subfolders.

Type one or more characters in the filter field to filter the list to contain only clients with names that contain those characters.

Mouse shortcuts

The Avamar Administrator user interface supports context-sensitive left-click, right-click, and double-click shortcuts.

Right-click

All GUI elements that can enable features or functions when clicked, have right-click support added to them. However, if the GUI element only acts as a navigation mechanism, there is no right-click support. For example, the Policy window client tree has
a right-click shortcut menu because specific features and functions become available based on which node of the tree is selected.

**Double-click**
For all tables where properties or edit dialog boxes can be invoked, double-click any row of the table to display the properties or edit dialog box. Additionally, when lists are used rather than tables, double-click an element in the list to display the edit dialog box.

**Column heading sort**
Click a table column heading to sort that column. For example, double-click the *Activity Monitor State* column to sort the *Activity Monitor* by the state of each backup.

Press *Shift* and then click any table column heading to reverse sort the values in a table column.
CHAPTER 3
Client Management

This chapter includes the following topics:

- Overview of Avamar clients ................................................................. 48
- Client domains ..................................................................................... 48
- Client registration .................................................................................. 50
- Activating a client ................................................................................. 53
- Client paging ........................................................................................ 54
- Editing client information ..................................................................... 56
- Viewing client properties ....................................................................... 57
- Enabling and disabling a client ............................................................. 58
- Moving a client to a new domain .......................................................... 58
- Retiring a client ..................................................................................... 58
- Deleting a client .................................................................................... 59
Overview of Avamar clients

Avamar clients are networked computers or workstations that access the Avamar server over a network connection.

You can organize and segregate clients by using Avamar domains. Domains provide enhanced security by enabling you to define administrative user accounts on a domain-by-domain basis.

Before Avamar can back up or restore data on a client, you must add, or register, the client with the Avamar server, and then activate the client.

To provide maximum flexibility in deploying Avamar clients, registration and activation are separate events that occur asynchronously. Although they often occur at nearly the same time, they can also occur hours, days, or even weeks apart.

In Avamar Administrator, the client name must always be the client’s hostname. If you need to change the client name in Avamar Administrator because the client hostname changed, you must first shut down the Avamar software on the client computer, change the client name by editing the client information, then restart the Avamar client software. This is the only way to ensure that the client maintains its registration with the Management Console Server (MCS) database, which ensures that past backups continue to be associated with the client.

Client domains

Avamar client domains are distinct zones to organize and segregate clients in the Avamar server. This provides enhanced security by enabling you to define administrative user accounts on a domain-by-domain basis.

Avamar client domains are completely internal to the Avamar server and have nothing to do with Internet domains.

Nested structure

You can nest domains to create a rich tree structure. Consider the following example domain.

Figure 8 Avamar domain example

```
Avamar-1.example.com
  +--- Accounting
        +--- Gretchen's Computer
        +--- Randy's Computer
  +--- Engineering
        +--- Lab1 Wakup
        +--- Bob's Computer
        +--- Beth's Workstation
        +--- Dave's Computer
        +--- Mary's Computer
  +--- Operations
  +--- Maintenance
        +--- Dirk's Computer
        +--- Tallie's Computer
  +--- Shipping
        +--- Gary's Computer
        +--- Steve's Computer
```
The root domain, avamar-1.example.com, contains three departmental domains: Accounting, Engineering, and Operations. The Operations domain contains Maintenance and Shipping subdomains.

There is no functional difference between domains and subdomains. Subdomain is merely a term that refers to any domain nested within another higher level domain.

Hierarchical management
The real power of domains is that you can add administrators to a specific level on the client tree. These domain-level administrators can then manage the clients and policies within that domain.

For example, if you add an administrative user to the root domain, then that user can administer clients and policies anywhere in the system. However, if you add an administrative user to a domain, then that user can only administer clients and policies in that domain and its subdomains.

The procedures in this guide assume that you are logged in to the root domain. If you log in to a lower-level domain, you may not have access to specific clients, datasets, groups, and event management features outside that domain.

Special domains
You cannot delete the MC_RETIRED and REPLICATE domains.

The MC_RETIRED domain contains clients that have been retired. Its primary purpose is to facilitate restores from retired client backups.

The REPLICATE domain contains replicated data from other servers.

Creating a domain

Procedure
1. In Avamar Administrator, click the Administration launcher button.
   The Administration window appears.
2. Click the Account Management tab.
3. In the left pane, select the location in the tree in which to create the domain.
4. From the Actions menu, select Account Management > New Domain.
   The New Domain dialog box appears.
5. In the New Domain Name box, type the name of the domain.
   Domain names must be 63 characters or fewer, and must not use any of the following characters: =~!@#$%^\{}\()\[]\,"\;'\:\:\/:\,*<>\'\"\&.
6. (Optional) Type the name, telephone number, email address, and location for a contact for the domain in the remaining fields on the New Domain dialog box.
7. Click OK.
   A confirmation message appears.
8. Click OK.

Editing domain information

You can edit contact and location information for a domain.

Procedure
1. In Avamar Administrator, click the Administration launcher button.
   The Administration window appears.
2. Click the **Account Management** tab.
3. In the tree, select the domain to edit.
4. From the **Actions** menu, select **Account Management > Edit Domain**.
   The **Edit Domain** dialog box appears.
5. Edit the domain contact information.
6. Click **OK**.
7. Click **OK** on the confirmation message that appears.

Deleting a domain

When you delete a domain, the process also deletes any clients in the domain. To preserve the clients in the system, move the clients to a new domain before you delete the domain.

In addition, if you use directory service authentication, then Avamar removes the LDAP maps that use that domain for access. The associated directory service groups are otherwise unaffected by the deletion.

**Procedure**

1. **(Optional)** Move any clients in the domain to a new domain. Moving a client to a new domain on page 58 provides instructions.
2. In Avamar Administrator, click the **Administration** launcher button.
   The **Administration** window appears.
3. Click the **Account Management** tab.
4. In the tree, select the domain to delete.
5. From the **Actions** menu, select **Account Management > Delete Domain**.
   A confirmation message appears.
6. Click **Yes**.
7. Click **OK** on the second confirmation message that appears.

Client registration

Client registration is the process of establishing an identity with the Avamar server. Once Avamar “knows” the client, it assigns a unique client ID (CID), which it passes back to the client during activation.

There are three ways to register a client:
- Client-side registration
- Interactive server-side registration by using Avamar Administrator
- Batch client registration

Client-side registration

The client-side registration process depends on the operating system.

The *EMC Avamar Backup Clients User Guide* describes client-side registration for each supported operating system.

Client-side registration also activates the client at the same time. For this reason, client-side registration is very popular. However, the client is automatically added to the Default
Group and must use the default dataset, schedule, and retention policy. As a result, this method may not provide enough control for some sites.

Registering a client in Avamar Administrator

You can use Avamar Administrator to add a client to the system in a domain and group. This provides a high degree of control. For example, you can assign a specific dataset, schedule, and retention policy. However, it can be very time consuming if you need to add many clients.

Procedure
1. In Avamar Administrator, click the Administration launcher button. The Administration window appears.
2. Click the Account Management tab.
   In the Account Management tree, the icons for the clients indicate status. An x appears for disabled clients, a question mark appears for unregistered clients, and there is no special icon designation for active clients.
3. In the tree, select the domain for the new client.
4. From the Actions menu, select Account Management > New Client. The New Client dialog box appears.
5. From the Client Type list, select Normal.

   NOTICE
   The EMC Avamar for VMware User Guide provides information on VMware vCenter™, Image Proxy, and Virtual Machine client types.

6. In the New Client Name field, type the client name.
7. (Optional) Type the client contact name, telephone number, email address, and location in the remaining fields of the New Client dialog box.
8. Click OK.
   A confirmation message appears.
9. Click OK.

Batch client registration

To support large sites with many clients, the batch client registration feature enables you to define multiple clients in a single client definition file, then validate and import that file into the Avamar server.

Batch client registration is very popular at large sites because it provides nearly as much control as interactively adding the client using Avamar Administrator but is much faster.

Clients definition files

Avamar supports Extensible Markup Language (XML) and comma-separated values (CSV) formats for the clients definition file for batch client registration.

XML format
XML clients definition files must have an .xml file extension and conform to the following structure and format:

```xml
<?xml version="1.0" encoding="UTF-8" ?>
<registration_stream>
```
<registrants>
  <entry>
    <host_name>MyClient.Example.com</host_name>
    <mcs_domain>clients</mcs_domain>
    <mcs_group>MyGroup</mcs_group>
    <dataset>MyDataset</dataset>
    <retention_policy>MyRetentionPolicy</retention_policy>
    <contact_address>192.168.31.5</contact_address>
    <contact_port>28002</contact_port>
    <access_list>user1@avamar:password, user2@LDAP</access_list>
    <encryption>high</encryption>
    <encryption_override>false</encryption_override>
  </entry>
</registrants>

**NOTICE**

The clients definition file in this topic is for reference purposes only. Do not attempt to copy and paste this example into a clients definitions file. Invisible formatting characters will prevent you from successfully doing so.

Define each client by using a separate `<entry>` element. The following table describes the available attributes for each `<entry>` element.

**Table 14 Attributes for each entry in a clients definition file**

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>host_name</td>
<td>Network hostname or IP address for this client.</td>
</tr>
<tr>
<td>mcs_domain</td>
<td>Optional Avamar domain for this client. Specifying a value for this attribute overrides the default clients domain.</td>
</tr>
<tr>
<td>mcs_group</td>
<td>Optional default group for this client. Specifying a value for this attribute overrides assignment to the Default Group.</td>
</tr>
<tr>
<td>dataset</td>
<td>Optional default dataset for this client to use during backups. Specifying a value for this attribute overrides the default dataset that would normally be inherited from the group.</td>
</tr>
<tr>
<td>retention_policy</td>
<td>Optional default backup retention policy for this client. Specifying a value for this attribute overrides the default retention policy that would normally be inherited from the group.</td>
</tr>
<tr>
<td>contact_address</td>
<td>Optional client IP address.</td>
</tr>
<tr>
<td>contact_port</td>
<td>Set this to 28002, the default Avamar data port.</td>
</tr>
<tr>
<td>access_list</td>
<td>Optional list of users who can access the Avamar server from this client. The format is user@authentication:password. When you use the internal authentication system, the word password must follow the colon. This causes the system to prompt users for authentication when they access the system. When you use an external authentication system, omit password. To define multiple users, separate each user entry with a comma (,) and enclose the entire list of users in quotation marks (&quot; &quot;).</td>
</tr>
<tr>
<td>encryption</td>
<td>Encryption method for client/server data transfer:</td>
</tr>
</tbody>
</table>
Table 14 Attributes for each entry in a clients definition file (continued)

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>encryption override</td>
<td>Optional encryption override. If TRUE, then this client does not use the group encryption method.</td>
</tr>
</tbody>
</table>

**Note**
The encryption technology and bit strength for a client/server connection depends on several factors, including the client platform and Avamar server version. The *EMC Avamar Product Security Guide* provides details.

**CSV format**
CSV clients definition files use the same element and attribute names as the XML format. However, you must define each client on a single line and separate each attribute value by a comma, as shown in the following example:

`host_name,mcs_domain,mcs_group,dataset,retention_policy,contact_address,contact_port,access_list,encryption,encryption_override`

**Validating and importing a clients definition file**

**Procedure**
1. In Avamar Administrator, click the Administration launcher button.
   The Administration window appears.
2. Click the Account Management tab.
3. From the Actions menu, select Account Management > Import Clients from File.
   The Validate dialog box appears.
4. Browse to and select the saved clients definition file.
5. Click Validate.
   The Validation Results dialog box appears.
6. If the clients definition file is error free, click Commit to import the client list. Or, if the clients definition file contains errors, correct the errors, save the file again, and repeat the steps in this procedure.
   The Validation Results dialog box closes, and the new clients appear in the Account Management tree.

**Activating a client**

Client activation is the process of passing the client ID (CID) back to the client, where it is stored in an encrypted file on the client file system.

There are two ways to activate a client:
Initiate activation from the client. The *EMC Avamar Backup Clients User Guide* describes this method.

Invite the client to activate with the server by using Avamar Administrator.

**NOTICE**

HP-UX, Linux, and Solaris clients can either be activated during installation or by using Avamar Administrator. There is no client-side command to initiate client activation on these computing platforms.

**Procedure**

1. Ensure that the following requirements are met:
   - The client must be present on the network.
   - The Avamar client software must be installed and running on the client.
   - The Avamar server must be able to resolve the hostname that was used to register the client.
2. In Avamar Administrator, click the **Administration** launcher button.
   The **Administration** window appears.
3. Click the **Account Management** tab.
   In the **Account Management** tree, the icons for the clients indicate status. An x appears for disabled clients, a question mark appears for unregistered clients, and there is no special icon designation for active clients.
4. In the tree, select the client to activate.
5. From the **Actions** menu, select **Account Management** > **Invite Client**.
   A status message indicates that the client was sent an invitation to activate with the server.
6. Click **OK**.

**Client paging**

Avamar clients can be either pageable or non-pageable. If a client is pageable you can specify settings to control how the MCS determines the appropriate paging settings for the client. You may need to use workarounds for limitations that exist in environments with non-pageable clients.

**Pageable clients**

Pageable clients have provided the Avamar server with a page address and port number, which enables performance of on-demand backups and restores. In addition, Avamar Administrator can browse the client file system during backups and restores in Avamar Administrator.

You can specify one of the following client paging settings to control how the MCS determines the appropriate paging settings for a client:

- **Automatic** — With the default setting of automatic paging, the MCS attempts to automatically determine appropriate paging settings for the client. If the MCS receives updated paging information from the client, it automatically updates the settings.
- **Manual** — With manual paging, you specify the IP address and data port number for client/MCS communications. You may want to use manual paging if you use Network
Address Translation (NAT). With NAT, the MCS probably cannot automatically determine the correct client paging settings. In manual mode, the MCS never overwrites the IP address and port number settings for the client.

You can also disable automatic paging without specifying an IP address or data port number for client/MCS communications. Disabling automatic paging might be useful to support clients that are off the network for extended periods of time, as can be the case with laptop computers. These clients must initiate their own on-demand backups. For this reason, you should enable client paging whenever possible.

Non-pageable clients

A client is non-pageable when the Avamar Administrator server running on the Avamar server utility node or on a single-node server cannot establish a TCP/IP connection to port 28002 on the Avamar client.

When a client might be non-pageable

A client might be non-pageable in the following situations:

- The environment (including the client) has firewall rules that prevent incoming connections on port 28002 to the client.
- The client is behind a router that doesn’t support port-forwarding for connections initiated from the Avamar server. (This is the common situation that managed service providers could encounter if they deploy Avamar without using VPN, for example.)
- The Avamar Administrator server cannot connect to the Avamar client on the paging address used by the Avamar Administrator server. One example of this is if the client is multi-homed and the paging address used by the Avamar Administrator server to connect to the client does not have a route to the paging address.
- The environment requires authentication to establish a host-to-host connection to port 28002 on the client, and the Avamar Administrator server process is not able to support the required authentication protocol.
- An IPSEC environment. In a Windows environment Microsoft best practices recommend enabling IPSEC, and clients are not pageable in an IPSEC environment.

MCS should automatically detect non-pageable clients and adjust settings. Usually no manual changes are needed in MCS. You can determine whether a client is pageable or non-pageable by viewing the properties for the client on the Policy window of Avamar Administrator. If No appears in the Paging column for the client, then MCS cannot connect to the avagent process on the client and the client is non-pageable.

Limitations in environments with non-pageable clients

You can use Avamar Administrator to perform backups or restores, or define policies in environments with non-pageable clients. In some cases you must enter explicit path names.

The following limitations apply when the client is non-pageable:

- If the MCS cannot page the client on port 28002, then Avamar cannot invite the client to activate by using Avamar Administrator.
- You cannot browse the client file system when defining datasets or when browsing to select a target for restore. To work around this limitation, explicitly define the backup dataset without browsing a client. During a restore, explicitly type the restore target path.
- You cannot view client logs by double-clicking on the Activities view. To work around this limitation, get the logs from the client computer.
You cannot page the client when there is a work order waiting for the client. In this case, the client connects to the MCS and polls for the existence of a work order approximately once every minute. If you are backing up several hundred or more non-pageable clients, you may need to increase the polling interval. The default polling interval is 60 seconds. If MCS performance is slowing down, increase the polling interval until you achieve acceptable performance.

Editing client paging settings

The MCS can automatically determine client paging settings, or you can manually specify paging settings for a client. You may need to manually specify paging settings if you use NAT.

Procedure

1. In Avamar Administrator, click the Policy launcher button. The Policy window appears.
2. Click the Policy Management tab.
3. Click the Clients tab.
4. Select the client.
5. From the Actions menu, select Client › Edit Client. The Edit Client window appears.
6. Click the Properties tab.
7. Select either the Automatic or Manual paging mode.
8. If you selected Manual, specify the client information for client/MCS communications:
   - If the MCS is unable to automatically determine a hostname for this client in automatic mode, type a valid (un-NAT’d) IP address for the client in the Address box.
   - In the Port Number box, specify the data port number. The default data port is 28002.
9. Click OK.

Editing client information

You can edit the name, contact information, or location information for a client in Avamar Administrator.

In Avamar Administrator, the client name must always be the client hostname. If you need to change the client name in Avamar Administrator because the client hostname changed, you must first shut down the Avamar software on the client computer, change the client name by way of this procedure, then restart the Avamar client software. This is the only way to ensure that the client maintains its registration with the Management Console Server (MCS) database, which ensures that past backups continue to be associated with the client.

Procedure

1. In Avamar Administrator, click the Administration launcher button. The Administration window appears.
2. Click the Account Management tab.
In the **Account Management** tree, the icons for the clients indicate status. An x appears for disabled clients, a question mark appears for unregistered clients, and there is no special icon designation for active clients.

3. In the tree, select the client to edit.
4. From the **Actions** menu, select **Account Management > Edit Client**.
   The **Edit Client** dialog box appears.
5. Edit the name, contact information, or location information for the client.
6. Click **OK**.
   A confirmation message appears.
7. Click **OK**.

**Viewing client properties**

**Procedure**

1. In Avamar Administrator, click the **Policy** launcher button.
   The **Policy** window appears.
2. Click the **Policy Management** tab.
3. Click the **Clients** tab.
4. Select the client.

   The client properties described in the following table appear in the main pane of the window.

**Table 15 Client properties displayed by Avamar Administrator**

<table>
<thead>
<tr>
<th>Column</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Client</td>
<td>Descriptive client name.</td>
</tr>
<tr>
<td>Backups Disabled</td>
<td>Whether Avamar can perform backups for the client. Regardless of this setting, the client can restore files as long as a previous backup exists in the system.</td>
</tr>
<tr>
<td>Activated</td>
<td>Whether the client is activated with the Avamar server.</td>
</tr>
<tr>
<td>Domain</td>
<td>The Avamar domain for the client.</td>
</tr>
<tr>
<td>OS</td>
<td>The operating system on the client.</td>
</tr>
<tr>
<td>Paging</td>
<td>Whether the client has provided the Avamar server with a page address and port number, thereby allowing it to perform on-demand backups and restores. In addition, Avamar Administrator can browse its file system during Avamar Administrator-initiated backups and restores.</td>
</tr>
<tr>
<td>Version</td>
<td>The version of Avamar client software on the client.</td>
</tr>
<tr>
<td>Last Check-in</td>
<td>The date and time that the Avamar client agent last checked in with the Avamar server.</td>
</tr>
<tr>
<td>Encryption</td>
<td>The encryption method used for client/server data transfer.</td>
</tr>
<tr>
<td>CID</td>
<td>The Client ID, a unique identifier for this client in the Avamar server. CIDs are assigned during client activation.</td>
</tr>
</tbody>
</table>
Enabling and disabling a client

You can disable a client so that it cannot use the Avamar server to back up files. This is typically done to place the system in a state that supports maintenance activities. If a client has been disabled, you must reenable the client before backups for the client can resume.

Procedure

1. In Avamar Administrator, click the Policy launcher button.
   The Policy window appears.
2. Click the Policy Management tab.
3. Click the Clients tab.
4. Select the client to disable or enable.
5. From the Actions menu, select Client > Disable all backups of selected client.
   A confirmation message appears.
6. Click Yes.

   When the client is disabled, a checkmark appears next to the Disable all backups of selected client option on the Actions > Client menu. When the client is enabled, the checkmark does not appear.

Moving a client to a new domain

Procedure

1. In Avamar Administrator, click the Administration launcher button.
   The Administration window appears.
2. Click the Account Management tab.
   In the Account Management tree, the icons for the clients indicate status. An x appears for disabled clients, a question mark appears for unregistered clients, and there is no special icon designation for active clients.
3. In the tree, select the client to move.
4. From the Actions menu, select Account Management > Move Client.
   The Move Client dialog box appears.
5. Select the new domain for the client.
6. Click OK.

Retiring a client

When you retire a client, Avamar stops running backups of the client. Avamar uses the specified retention setting for the existing backups of a retired client to determine how long to retain the existing backups. Avamar also uses the specified retention setting for existing replicas of a retired client’s backups to determine how long to retain the existing replicas.

To restore data from existing backups or replicas of a retired client, use Avamar Administrator.
Procedure

1. In Avamar Administrator, click the Administration launcher button. The Administration window appears.

2. Click the Account Management tab.

   In the Account Management tree, the icons for the clients indicate status. An x appears for disabled clients, a question mark appears for unregistered clients, and there is no special icon designation for active clients.

3. In the tree, select the client to retire.

4. From the Actions menu, select Account Management > Retire Client. The Retire Client dialog box appears.

5. In the Local Backups section, choose how long to keep backups for the client:
   - To keep backups until their existing expiration dates, select Retain local backups with existing expiration date.
   - To keep backups indefinitely, regardless of the existing expiration dates, select Retain all local backups indefinitely.
   - To keep backups until a new expiration date, select Reset local backup expiration date and in New Expiration Date, select a new date.

6. (Client with replicas) In the Remote Backups section, choose how long to keep replicas for the client:
   - To keep replicas until their existing expiration dates, select Retain remote backups with existing expiration date.
   - To keep replicas indefinitely, regardless of the existing expiration dates, select Retain all remote backups indefinitely.
   - To keep replicas until a new expiration date, select Reset remote backup expiration date and in New Expiration Date, select a new date.

7. Click OK.

   A confirmation message appears.

8. Click Yes.

Deleting a client

Delete a client and all backups of the client. Optionally, choose to delete all replicas that existing on replication destination systems.

When you delete a client, Avamar permanently deletes all backups that are stored for that client. Only delete a client when you are certain that there is no reason to retain the backups. If there is any doubt, retire the client instead.

Procedure

1. In Avamar Administrator, click the Administration launcher button. The Administration window appears.

2. Click the Account Management tab.

   In the Account Management tree, the icons for the clients indicate status. An x appears for disabled clients, a question mark appears for unregistered clients, and there is no special icon designation for active clients.
3. In the tree, select the client to delete.

4. From the Actions menu, select Account Management > Delete Client.
   The Delete Client dialog box appears and displays the number of existing backups for
   the client.

5. (Clients with replicas) Choose how to handle the client’s replicas:
   - To delete all replicas for the client, select Also delete remote backups on external
     servers.
   - To retain all replicas for the client, clear Also delete remote backups on external
     servers.

6. Select I understand this action is permanent and irreversible.
   This field is a safety net to avoid unintentionally deleting a client and the client’s
   backups.

7. Click Delete.
CHAPTER 4
User Management and Authentication

This chapter includes the following topics:

- Overview of Avamar user accounts ................................................................. 62
- User authentication ......................................................................................... 62
- Avamar internal authentication ........................................................................ 63
- Directory service authentication ...................................................................... 64
- Enabling backward compatibility with Enterprise Authentication ................ 80
- Roles .............................................................................................................. 81
- Adding a user to a client or domain ............................................................... 83
- Editing user information ................................................................................ 85
- Deleting a user ............................................................................................... 85
Overview of Avamar user accounts

A user account in Avamar can administer a domain or client. The user account defines the authentication system that is used to grant users access to the Avamar server. It also defines the role for the user, which controls the operations that a user can perform.

You can add user accounts to domains or individual clients. When you add a user account to a domain, the account can administer that domain and any subdomains beneath it. When you add a user account to an individual client, the account can perform backups and restores of that client, and access backups belonging to that client in the system.

In Avamar, users are entries in a domain or client access list. When you add a user account to the Avamar system, you are adding an entry to a domain or client user access list.

In the following example, the user “Gretchen” has been added to both the Accounting domain and a computer. However, the authentication system and role are completely separate user accounts that happen to have the same username.

Figure 9  Users in Avamar domains

The following table describes the information that comprises an Avamar user account.

Table 16 Avamar user account information

<table>
<thead>
<tr>
<th>Information</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Username</td>
<td>The username depends on the authentication system and must be in the format that the authentication system accepts. For example, the internal authentication system uses case-sensitive usernames, whereas Windows Active Directory usernames are case-insensitive. Usernames cannot be longer than 31 characters.</td>
</tr>
<tr>
<td>Authentication system</td>
<td>An authentication system is a username/password system that is used to grant users access to the Avamar server.</td>
</tr>
<tr>
<td>Role</td>
<td>Roles define the allowable operations for each user account.</td>
</tr>
</tbody>
</table>

User authentication

An authentication system is a username/password system that is used to grant users access to the Avamar server.

Avamar supports the following authentication systems:

- Avamar internal authentication, as described in Avamar internal authentication on page 63.
• Directory service authentication, as described in Directory service authentication on page 64.

Avamar also supports the deprecated authentication method Enterprise Authentication. Enabling backward compatibility with Enterprise Authentication on page 80 describes how to enable continued support for Enterprise Authentication.

How Avamar authenticates users and assigns roles

To provide backward compatibility with enterprise authentication and to account for the possibility of users in more than one LDAP mapped group, Avamar uses the following authentication and role assignment sequence for each login try:

1. When the username is in the format user, where useris a username without @server appended, then Avamar checks the internal Avamar authentication database. If the username, password, and domain match, then the login is successful and Avamar assigns the user a role in the Avamar database. If they do not match, then the login fails.

2. When the username is in the format user@server, where user is a username and server is the fully qualified domain name of the authentication server, then Avamar checks the login information by using enterprise authentication. If the username, password, and domain match, then the login is successful and Avamar assigns the user a role in the Avamar database. If there is no match, then the evaluation continues.

3. When the username is in the format user@server and authentication by using enterprise authentication fails, then Avamar checks the LDAP mapping system. The login try is checked against all mapped groups for a match of each of the following identifiers:
   • Username, the portion of the User Name field entry before the @ symbol.
   • Password, as typed in the Password field.
   • Avamar domain, as typed in the Domain Name field.
   • Directory service domain, the portion of the User Name field entry after the @ symbol.

   When all identifiers match, the login is successful and Avamar assigns the user a role from the mapped group.

   A user can be the member of mapped groups in different directory service domains. The role of the mapped group that matches the directory service domain that is provided during login is assigned to the user for that session.

   When the user is a member of more than one mapped group in the same directory service domain, the role with the greatest authority is assigned.

4. When the login information does not meet the requirements of any of the previous steps, then the login fails and a failure message appears.

Avamar internal authentication

With Avamar internal authentication, you define the username and password for Avamar user accounts, and Avamar stores the information. Usernames are case-sensitive and cannot be longer than 31 characters.

No additional steps are required to use internal Avamar authentication to authenticate user accounts. You define the username and password for each account when you add the user in Avamar Administrator.
Directory service authentication

Use directory service authentication to authenticate and assign roles to Avamar users by using information from an existing directory service. Directory service authentication works with specific LDAP directory services and provides additional functionality when used with an OpenLDAP directory service. Directory service authentication also works with a Network Information Service (NIS), on its own or with one of the supported LDAP directory services.

Avamar products that use directory service authentication
The following Avamar products can use directory service authentication to authenticate and authorize users:
- Avamar Administrator
- Avamar Web Restore
- Avamar client web UI (Avamar Desktop/Laptop)

Avamar product that uses directory service client records
Avamar Client Manager does not use directory service authentication to authenticate and authorize user logins. However, Avamar Client Manager can use the directory service mechanism to obtain information about computers that are potential Avamar clients. Avamar Client Manager queries the directory service to obtain information about clients and, if available, directory service organizational units, such as directory domains, and directory groups.

Directory services types
Directory service authentication supports the following types of directory services:

<table>
<thead>
<tr>
<th>Type</th>
<th>Supported directory service types</th>
</tr>
</thead>
</table>
| LDAP   | • Active Directory for Windows Server 2003  
|        | • Active Directory Domain Services for Windows Server 2008  
|        | • Active Directory Domain Services for Windows Server 2012  
|        | • 389 Directory Server version 1.1.35 |
| OpenLDAP | • SUSE OpenLDAP version 2.4 |
| NIS     | • Network Information Service |

LDAP maps
Directory service authentication uses LDAP maps to form a group of Avamar domain users by using information from a directory service. Create LDAP maps to link Avamar authorization levels to mapped directory service user accounts. Refer to Adding an LDAP map on page 77 for more information.

NOTICE
Deleting an Avamar domain removes the LDAP maps that rely on that Avamar domain for access. However, removing LDAP maps does not affect the directory service groups or the directory service user records that are associated with the removed maps.
LDAP directory service authentication

Avamar provides authentication and authorization of Avamar users through supported LDAP directory services.

Preparing to use LDAP directory service authentication on page 65 describes how to prepare to implement LDAP directory service authentication.

Adding information for a supported LDAP directory service on page 66 describes how to provide the required information about the LDAP directory service to the Avamar system.

Editing the directory service configuration files on page 68 describes how to perform an optional manual edit of the ldap.properties and krb5.conf files.

Requirements

Avamar directory service authentication supports the use of supported LDAP directory services that meet the following conditions:

- LDAP server permits username bind through both of the following formats:
  - username
  - username@domain.com
- LDAP server permits searching for group membership by using a username.
- LDAP server permits searching for groups by using a search string.
- LDAP server account that is provided when adding an LDAP map has permission to run a nested ldapsearch command.

Kerberos protocol

Avamar’s LDAP directory service authentication normally uses the Kerberos protocol for all communications with the Key Distribution Center. Avamar automatically encrypts usernames and passwords before sending them to port 88 on the Key Distribution Center.

To use Avamar’s LDAP directory service authentication without the Kerberos protocol, in a Simple Bind, manually edit the ldap.properties file.

Preparing to use LDAP directory service authentication

To prepare to use LDAP directory service authentication, give Avamar access to certain ports on the Key Distribution Center. Also, create the directory service groups that are associated with Avamar LDAP maps.

Procedure

1. Ensure that Avamar has access to the following recognized ports on the Key Distribution Center (KDC).

<table>
<thead>
<tr>
<th>Port number</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>88</td>
<td>Kerberos authentication system</td>
</tr>
<tr>
<td>389</td>
<td>Lightweight Directory Access Protocol (LDAP)</td>
</tr>
<tr>
<td>464</td>
<td>Kerberos Change/Set password</td>
</tr>
</tbody>
</table>

The ports are defined in krb5.conf and ldap.properties. Editing the directory service configuration files on page 68 provides instructions on editing these files.
2. Create directory service groups in the directory service (not in Avamar).

Groups can range in size from one member to as many members as the directory service allows.

Ideally, create directory service groups specifically for use with an Avamar LDAP map. With dedicated directory service groups, group composition is considered in the context of the level of Avamar access being granted. Also, the group name can include a common character pattern to simplify its discovery during mapping. For example, you could start each group name with the characters `av`, as in `avAdministrators`. This character pattern would enable you to search for all groups that are associated with Avamar by using the wildcard search string `av*`.

**After you finish**

Configure Avamar to use the LDAP directory service. *Adding information for a supported LDAP directory service on page 66* provides instructions.

**Adding information for a supported LDAP directory service**

Use a wizard to add information for a supported LDAP directory service to use for authentication and authorization of Avamar users.

**Before you begin**

Check that the directory service meets the following requirements:

- Provides authentication through a SASL (Simple Authentication and Security Layer) BIND that uses Kerberos.
- Only uses LDAP v.3 base functionality.
- Permits username bind through both of the following formats:
  - `username`
  - `username@domain.com`
- Permits searching for group membership by using a username.
- Permits searching for groups by using a search string.
- Has an available LDAP server account that has permission to run a nested `ldapsearch` command.

**NOTICE**

Do not use the wizard to add a directory service that performs authentication using Simple Bind (plaintext). Instead, manually edit the `ldap.properties` file as described in *Editing the directory service configuration files on page 68.*

**Procedure**

1. Log in to the root domain in Avamar Administrator as an administrator.
   a. Launch Avamar Administrator.
   b. In the **Username** box in the login window, type a username for an account that is assigned the administrator role at the root domain level.
      
      When Avamar is already configured to use a directory service, alternatively log in by using an LDAP account with administrator authorization at the root domain level. Use the format: `username@ldap-domain`.
      
      c. In **Password**, type the password for the user account.
d. In **Domain Name**, use the default entry of a single slash (/) character to specify the root domain.

e. In **Avamar Server**, type the IP address or DNS name of the Avamar server.

f. Click **Log On**.

2. In Avamar Administrator, click the **Administration** launcher button.

   The **Administration** window appears.

3. Click the **LDAP Management** tab.

4. Click **Directory Service Management**.

   The **Directory Service Management** dialog box appears.

5. Add the directory service:

   a. Click **Add**.

      The **Adding a new Directory Service** section appears.

   b. Select **LDAP**.

   c. In **Enter a fully qualified domain name**, type the fully qualified domain name (FQDN) of a directory server.

   d. (Optional) If the directory server represents the organization’s default directory service domain, then select **Make this the default domain LDAP domain**.

      To allow the Avamar client web UI to authenticate users from Macintosh computers, the LDAP server that is assigned to Macintosh users must be configured as the default server.

   e. Click **Add**.

      A confirmation message appears.

   f. Click **Yes**.

      A success message appears. If an error message appears instead, then resolve the issue and re-add the directory service. **Error messages during directory service configuration on page 76** provides details.

   g. Click **OK**.

      The changes are applied to the Management Console Server (**mcs**) and EM Tomcat (**emt**) services.

6. (Optional) Repeat the previous step to add other authentication domains.

7. Test the directory service entries:

   a. In the **Directory Service Management** dialog box, select one of the entries from **Configured Directory Services**.

      The **Testing** section appears.

   b. In **Username**, type the username for an account that is authorized to read the directory service database.

   c. In **Password**, type the password that is associated with the username.

   d. Click **Run Test**.

      If an error message appears, then resolve the issue. **Error messages during directory service configuration on page 76** provides details.

   e. Click **Close** to close the **Testing** section.

After you finish

Create an LDAP map to associate the directory service group to Avamar user information. Adding an LDAP map on page 77 provides instructions.

Editing the directory service configuration files

The LDAP Management tool provides you with the ability to manually edit the ldap.properties and krb5.conf directory service configuration files. Manually edit these files to configure non-standard settings and to resolve problems that occur when configuring Avamar to use a directory service.

Before you begin

Determine the correct format for keys and values in the configuration files.

Procedure

1. Log in to the root domain in Avamar Administrator as an administrator.
   a. Launch Avamar Administrator.
   b. In the Username box in the login window, type a username for an account that is assigned the administrator role at the root domain level.

   When Avamar is already configured to use a directory service, alternatively log in by using an LDAP account with administrator authorization at the root domain level. Use the format: username@ldap-domain.
   c. In Password, type the password for the user account.
   d. In Domain Name, use the default entry of a single slash (/) character to specify the root domain.
   e. In Avamar Server, type the IP address or DNS name of the Avamar server.
   f. Click Log On.

2. In Avamar Administrator, click the Administration launcher button.
   The Administration window appears.

3. Click the LDAP Management tab.

4. Click Edit LDAP file to edit ldap.properties or Edit KR5 file to edit krb5.conf.

5. Type additions and changes directly in the Edit file window.

6. Click Save, and then click Close.

Format requirements and settings for LDAP base functionality

The LDAP Management tool in Avamar Administrator creates a correctly formatted ldap.properties file for supported LDAP directory services. When you manually edit the file by using the LDAP Management tool, the format must comply with specific parameter requirements. You can manually add other settings to ldap.properties to meet an organization’s authentication requirements.

LDAP base functionality parameter requirements

The following table lists the parameter requirements for LDAP base functionality.
Table 19 Parameter requirements for LDAP base functionality

<table>
<thead>
<tr>
<th>Rule</th>
<th>Description</th>
<th>Format</th>
</tr>
</thead>
</table>
| One LDAP URL parameter for each LDAP server | The LDAP URL parameter maps an LDAP server to a specific domain controller. | `ldap.url.ds.example.abc.com=ldap://dchost.r1.example.abc.com:389` where:  
- `ds.example.abc.com` is the FQDN of the LDAP server.  
- `dchost.example.abc.com` is the FQDN of the domain controller for the LDAP server.  
- `389` is the port that is used by the LDAP service. |
| Exactly one default server parameter | The default server parameter is used during authentication of users on clients that are not mapped to a specific domain. For example, local users and users that log in from an AIX, FreeBSD, HP-UX, Linux, SCO, or Solaris computer. | `ldap.qualified-name-default=dshost.example.abc.com` where `dshost.example.abc.com` is the FQDN of the default LDAP server. |

Additional parameters
You can add other parameters to `ldap.properties` by using the LDAP Management tool in Avamar Administrator. The following table lists the available settings.

Table 20 Additional parameter for LDAP base functionality

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description and values</th>
</tr>
</thead>
</table>
| `ldap.auth.domain.login-domain-suffix` | Specifies a login domain name suffix that is included as part of the username value when authenticating through LDAP, where `login-domain-suffix` is the login domain name suffix and the value is an authentication domain. For example, users can log in using either: `username@boston` or `username@boston.edu`, where this parameter is set as follows:  

```
ldap.auth.domain.boston=boston.edu
```

Use this parameter along with the next parameter, `ldap.query.domain`, to map multiple authentication domains to a single login domain name suffix. |
| `ldap.query.domain.login-domain-suffix` | Maps additional authentication domains to a single login domain suffix, where the `ldap.auth.domain` parameter `login-domain-suffix` is defined by the `ldap.auth.domain` parameter, and the `ldap.query.domain` values are additional authentication domains within the organization’s intranet. For example, users from either authentication domain log in using the format `username@boston`, where the two parameters are set as follows:  

```
ldap.auth.domain.boston=boston.edu
ldap.query.domain.boston=science.boston.edu,art.boston.edu
```
| `ldap.entry.lookup.typeldap-domain` | Defines the method that is used by the LDAP server when looking up a username, where `ldap-domain` is the authentication domain. Possible values are:  
- UN for username, the method that is commonly used by LDAP directory services. (Default) |
### Table 20 Additional parameter for LDAP base functionality (continued)

<td>Specifies the IP address of the NIS domain server, where nisdomainname is the value of nis.qualified-name-default.</td>
</tr>
</tbody>
</table>

### OpenLDAP directory service authentication

Avamar supports authentication and authorization of Avamar users through an OpenLDAP directory service.

Adding information about an OpenLDAP directory service to Avamar is described in Adding an OpenLDAP directory service on page 70.

Configuring Avamar to use an OpenLDAP directory service for authentication includes the ability to use optional parameters that exist for OpenLDAP. OpenLDAP directory service parameters on page 73 describes the required and optional parameters for OpenLDAP.

#### Adding an OpenLDAP directory service

Edit the ldap.properties file to configure an Avamar system to use an OpenLDAP directory service for authentication.

Add an OpenLDAP directory service by manually editing the ldap.properties file of the Avamar server and adding the required parameters. Optional parameters can also be added to control how the Avamar system interacts with the OpenLDAP directory service.
OpenLDAP directory service parameters on page 73 provides more information about the required and optional parameters.

**Procedure**

1. Log in to the root domain in Avamar Administrator as an administrator.

   a. Launch Avamar Administrator.

   b. In the **Username** box in the login window, type a username for an account that is assigned the administrator role at the root domain level.

      When Avamar is already configured to use a directory service, alternatively log in by using an LDAP account with administrator authorization at the root domain level. Use the format: `username@ldap-domain`.

   c. In **Password**, type the password for the user account.

   d. In **Domain Name**, use the default entry of a single slash (`/`) character to specify the root domain.

   e. In **Avamar Server**, type the IP address or DNS name of the Avamar server.

   f. Click **Log On**.

2. In Avamar Administrator, click the **Administration** launcher button.

   The **Administration** window appears.

3. Click the **LDAP Management** tab.

4. Click **Edit LDAP file** to edit `ldap.properties`.

   The **Edit ldap.properties file** dialog box appears.

5. In the text entry area, type the following, on a new line:

   ```
   ldap.entry.lookup.type.ldap-domain=DN
   ```

   where `ldap-domain` is the domain name of the OpenLDAP server.

   This parameter is required.

6. In the text entry area, type the following, on a new line:

   ```
   ldap.userdn.ldap-domain=rdn-values
   ```

   where:

   - `ldap-domain` is the domain name of the OpenLDAP server
   - `rdn-values` is a semi-colon separated list of the relative distinguished name bases for users, from the root distinguished name of the LDAP tree.

      Each entry in the list is a comma-separated, reverse-hierarchical, representation of a user group’s relative distinguished name base.

   This parameter is required, unless either the users are directly under the root distinguished name or the LDAP server permits anonymous searches.

   For example, if the users for the domain `example.com` can be found in `Users`, inside `Employees`, inside `People`, at the tree root, and in `Admins` at the tree root, then type:

   ```
   ldap.userdn.example.com=ou=Users,ou=Employees,ou=People;ou=Admins
   ```

7. In the text entry area, type the following, on a new line:

   ```
   ldap.rootdn.ldap-domain=rootdn-format
   ```

   where:
• **ldap-domain** is the domain name of the OpenLDAP server
  
• **rootdn-format** is the root distinguished name format that is used by the LDAP server
  
This parameter is required, unless the LDAP server uses the following root distinguished name format: `dc=domain-segment,dc=domain-segment`

For example, an LDAP server that stores the root distinguished name as `dc=example,dc=com`, does not require this parameter in `ldap.properties`.

However, an LDAP server that stores the root distinguished name as `u=example,o=com` requires the following parameter in `ldap.properties`:

```
ldap.rootdn.example.com=u=example,o=com
```

8. In the text entry area, add optional OpenLDAP parameters.
   
   Type each parameter on a new line.

9. Click **Save**.

10. Test the directory service entries:

   a. In the **Directory Service Management** dialog box, select one of the entries from **Configured Directory Services**.

   The **Testing** section appears.

   b. In **Username**, type the username for an account that is authorized to read the directory service database.

   c. In **Password**, type the password that is associated with the username.

   d. Click **Run Test**.

   If an error message appears, then resolve the issue. **Error messages during directory service configuration on page 76** provides details.

   e. Click **Close** to close the **Testing** section.

11. Click **Close** on the **Directory Service Management** dialog box.

**Results**

The Avamar system enables authentication through the OpenLDAP directory service.

**After you finish**

Create an LDAP map to associate the directory service group to Avamar user information. **Adding an LDAP map on page 77** provides instructions.

**Enabling OpenLDAP and Avamar authentication**

Edit the `ldap.properties` file to configure an Avamar system to use Avamar authentication and OpenLDAP authentication.

**Before you begin**

Add an OpenLDAP directory service to the Avamar system.

After adding an OpenLDAP directory service for authentication, configure the Avamar system to use Avamar authentication for some of the Avamar domains.

**Procedure**

1. Log in to the root domain in Avamar Administrator as an administrator.

   a. Launch Avamar Administrator.
b. In the **Username** box in the login window, type a username for an account that is assigned the administrator role at the root domain level.

When Avamar is already configured to use a directory service, alternatively log in by using an LDAP account with administrator authorization at the root domain level. Use the format: `username@ldap-domain`.

c. In **Password**, type the password for the user account.

d. In **Domain Name**, use the default entry of a single slash (/) character to specify the root domain.

e. In **Avamar Server**, type the IP address or DNS name of the Avamar server.

f. Click **Log On**.

2. In Avamar Administrator, click the **Administration** launcher button.

   The **Administration** window appears.

3. Click the **LDAP Management** tab.

4. Click **Edit LDAP file** to edit `ldap.properties`.

   The **Edit ldap.properties file** dialog box appears.

5. In the text entry area, type the following, on a new line:

   ```
   user-login-module=mix
   ```

   This parameter is required when enabling Avamar authentication with OpenLDAP authentication.

6. In the text entry area, type the following, on a new line:

   ```
   user-login-module-mix-ldap=ldap
   ```

   This parameter is required when enabling Avamar authentication with OpenLDAP authentication.

7. In the text entry area, type the following, on a new line:

   ```
   avamar-authentication-domains=av-domain-list
   ```

   where `av-domain-list` is a comma-separated list of Avamar domains.

   The Avamar system uses Avamar authentication for login authentication of users from each listed domain. The Avamar system uses OpenLDAP authentication for all other users.

8. Click **Save**.

9. Click **Close** on the **Directory Service Management** dialog box.

**Results**

The Avamar system enables the specified mix of Avamar authentication and OpenLDAP authentication.

**OpenLDAP directory service parameters**

The following table describes the `ldap.properties` file parameters for use with an OpenLDAP directory service.
### Table 21 OpenLDAP directory service parameters

<table>
<thead>
<tr>
<th>Parameter and example</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ldap.entry.lookup.type.ldap-domain-DN</td>
<td>Specifies OpenLDAP. Replace <code>ldap-domain</code> with the domain name of the LDAP server. Use this parameter for OpenLDAP servers that accept user logins only in distinguished name format. For example: <code>uid=jsmith,dc=example,dc=com</code>. This parameter enables the other OpenLDAP parameters in this table.</td>
</tr>
<tr>
<td>For an LDAP domain &quot;xyz.com&quot; that uses OpenLDAP: ldap.entry.lookup.type.xyz.com=DN</td>
<td></td>
</tr>
<tr>
<td>ldap.userdn.ldap-domain-rdn-values</td>
<td>Specifies the relative distinguished name bases that are assigned to the organizational units that contains users. Replace <code>ldap-domain</code> with the domain name of the LDAP server and replace <code>rdn-values</code> with a semi-colon separated list of relative distinguished name bases for users, from the root distinguished name of the LDAP tree. Each entry in the list is a comma-separated reverse-hierarchical representation of a user group’s relative distinguished name base.</td>
</tr>
<tr>
<td>For an LDAP domain &quot;xyz.com&quot; that organizes users in the following organizational units:</td>
<td></td>
</tr>
<tr>
<td>• Managers which is under the tree root</td>
<td></td>
</tr>
<tr>
<td>• Accountants, <code>under people</code>, which is under the tree root</td>
<td></td>
</tr>
<tr>
<td>• HRs, <code>under Employees</code>, <code>under Users</code>, which is under the tree root</td>
<td></td>
</tr>
<tr>
<td>• Users, which is under the tree root</td>
<td></td>
</tr>
<tr>
<td>ldap.userdn.xyz.com=ou=Managers;ou=Accountants,ou=people;ou=HRs,ou=Employees,ou=Users;ou=Users</td>
<td></td>
</tr>
<tr>
<td>ldap.rootdn.ldap-domain-rootdn-format</td>
<td>Specifies the root distinguished name format of the LDAP server. This parameter is required unless the root distinguished name format is <code>dc=domain-segment,dc=domain-segment</code>. Replace <code>ldap-domain</code> with the domain name of the LDAP server and replace <code>rootdn-format</code> with the root distinguished name format that is used by the LDAP server.</td>
</tr>
<tr>
<td>For an LDAP domain &quot;xyz.com&quot; that stores the root distinguished name as <code>u=xyz,o=com</code>: ldap.rootdn.xyz.com=u=xyz,o=com</td>
<td></td>
</tr>
<tr>
<td>ldap.user.search.classes.ldap-domain-search-object</td>
<td>Specifies the object class type that is used by the user search filter. This parameter is optional. Replace <code>ldap-domain</code> with the domain name of the LDAP server and replace <code>search-object</code> with the value used to specify the object class type that is used by the user search filter. Comma separated values can be used. The default value is <code>*</code>.</td>
</tr>
<tr>
<td>For an LDAP domain &quot;xyz.com&quot; that uses the object class type &quot;person&quot; in user searches: ldap.user.search.classes.xyz.com=person</td>
<td></td>
</tr>
<tr>
<td>ldap.user.search.attrs.ldap-domain-search-attribute</td>
<td>Specifies the object class attribute that is used by the user search filter. This parameter is optional. Replace <code>ldap-domain</code> with the domain name of the LDAP server and replace <code>search-attribute</code> with a single attribute used by the user search filter. The default value is <code>uid</code>.</td>
</tr>
<tr>
<td>For an LDAP domain &quot;xyz.com&quot; that uses the object class attribute &quot;cn&quot; in user searches: ldap.user.search.attrs.xyz.com=cn</td>
<td></td>
</tr>
<tr>
<td>ldap.group.search.byUpn.classes.ldap-domain-search-upn</td>
<td>Specifies the object class type that is used by the group search User Principal Name filter. This parameter is optional. Replace <code>ldap-domain</code> with the domain name of the LDAP server and replace <code>search-upn</code> with the value used to specify the object class type that is used by the group search User Principal Name filter. Comma separated values can be used. The default value is <code>*</code>.</td>
</tr>
<tr>
<td>For an LDAP domain &quot;xyz.com&quot; that uses the User Principal Name object class types: sambaGroupMapping and posixGroup in group searches: ldap.group.search.byUpn.classes.xyz.com=sambaGroupMapping,posixGroup</td>
<td></td>
</tr>
<tr>
<td>ldap.group.search.byUpn.attrs.ldap-domain-upn-attributes</td>
<td>Specifies the object class attributes used by the group search User Principal Name filter. This parameter is optional. Replace <code>ldap-domain</code> with the domain name of the LDAP server and replace <code>upn-attributes</code> with the value used to specify the object</td>
</tr>
<tr>
<td>Parameter and example</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------</td>
<td>-------------</td>
</tr>
<tr>
<td>For an LDAP domain &quot;xyz.com&quot; that uses the User Principal Name object class attributes: memberUid and uniqueMember in group searches: <code>ldap.group.search.byUpn.attrs.xyz.com=memberUid,uniqueMember</code></td>
<td>class attributes used by the group search User Principal Name filter. Comma separated values can be used. The default value is memberUid,uniqueMember.</td>
</tr>
<tr>
<td><code>ldap.unique.group.search.classes.ldap-domain-unique-type</code></td>
<td>Specifies the object class type that is used by the Unique Groups group search filter. This parameter is optional. Replace <code>ldap-domain</code> with the domain name of the LDAP server and replace <code>unique-type</code> with the value used to specify the object class type that is used by the Unique Groups group search filter. Comma separated values can be used. The default value is sambaGroupMapping,posixGroup,groupOfUniqueNames.</td>
</tr>
<tr>
<td><code>ldap.unique.group.search.attrs.ldap-domain-unique-attributes</code></td>
<td>Specifies the object class attributes used by the Unique Groups group search filter. This parameter is optional. Replace <code>ldap-domain</code> with the domain name of the LDAP server and replace <code>unique-attributes</code> with the value used to specify the object class attributes used by the Unique Groups group search filter. Comma separated values can be used. The default value is cn.</td>
</tr>
<tr>
<td><code>user-login-module=mix</code></td>
<td>Enables authentication using the mix mode of Avamar authentication with OpenLDAP authentication. Configuration must also include: <code>user-login-module-mix-ldap=ldap</code> and <code>avamar-authentication-domains=av-domain-list</code>.</td>
</tr>
<tr>
<td><code>user-login-module-mix-ldap=ldap</code></td>
<td>Specifies that the Avamar system uses Avamar authentication with OpenLDAP authentication. Configuration must also include: <code>user-login-module=mix</code> and <code>avamar-authentication-domains=av-domain-list</code>.</td>
</tr>
<tr>
<td><code>avamar-authentication-domains=av-domain-list</code></td>
<td>Specifies the internal Avamar domains that the Avamar system checks during Avamar authentication. Replace <code>av-domain-list</code> with a comma-separated list of Avamar domains. Configuration must also include: <code>user-login-module=mix</code> and <code>user-login-module-mix-ldap=ldap</code>.</td>
</tr>
</tbody>
</table>

### Adding an NIS directory service

Provide authentication and authorization of Avamar users through an NIS directory service.

#### Procedure

1. Log in to the root domain in Avamar Administrator as an administrator.
   a. Launch Avamar Administrator.
   b. In the **Username** box in the login window, type a username for an account that is assigned the administrator role at the root domain level.

If you already configured a directory service, then you can log in with an account for an LDAP user with the administrator role at the root domain level.
c. In **Password**, type the password for the user account.

d. In **Domain Name**, use the default entry of a single slash (/) character to specify the root domain.

e. In **Avamar Server**, type the IP address or DNS name of the Avamar server.

f. Click **Log On**.

2. In Avamar Administrator, click the **Administration** launcher button.
   
The **Administration** window appears.

3. Click the **LDAP Management** tab.

4. Click **Directory Service Management**.
   
The **Directory Service Management** dialog box appears.

5. In the **Directory Service Management** dialog box, click **Add**.
   
The **Adding a new Directory Service** section appears.

6. Select **NIS**.

7. In **Enter a fully qualified domain name**, type the NIS domain name.

8. In **NIS Domain IP address**, type the IP address of the NIS server.

9. Click **Add**.
   
A confirmation message appears.

10. Click **Yes**.

If an error message appears, then resolve the issue and retry this task. **Error messages during directory service configuration on page 76** provides details.

A success message appears.

11. Click **OK**.

**Results**

The changes are applied to the Management Console Server (**mcs**) and EM Tomcat (**emt**) services.

**After you finish**

Create an LDAP map to associate the directory service group to Avamar user information. **Adding an LDAP map on page 77** provides instructions.

**Error messages during directory service configuration**

Error messages appear when issues occur during adding or testing of a directory service configuration.

The following table lists some of the potential messages and provides a description of the cause.

<table>
<thead>
<tr>
<th>Error message</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cannot discover KDC</td>
<td>A key distribution center (KDC) could not be found by using the specified domain information.</td>
</tr>
<tr>
<td>No URL is present</td>
<td>The specified domain is not present in the <code>ldap.properties</code> file.</td>
</tr>
</tbody>
</table>
### Table 22 Error messages during directory service configuration’ (continued)

<table>
<thead>
<tr>
<th>Error message</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parameters are not correct</td>
<td>The directory service domain information in the ldap.properties file is invalid.</td>
</tr>
<tr>
<td>Client not found in Kerberos database</td>
<td>The specified username is invalid.</td>
</tr>
<tr>
<td>Pre-authentication information was invalid</td>
<td>The specified password is incorrect.</td>
</tr>
<tr>
<td>Query fails</td>
<td>The specified user account does not have sufficient privileges to read the directory service database.</td>
</tr>
<tr>
<td>Clock skew too great</td>
<td>The differential between the clock on the Avamar server host and the clock on the directory service host is too large.</td>
</tr>
<tr>
<td>Cannot open LDAP configuration file</td>
<td>The ldap.properties file does not exist or the file permissions prevent access.</td>
</tr>
<tr>
<td>Cannot open Kerberos configuration file</td>
<td>The krb5.conf file does not exist or the file permissions prevent access.</td>
</tr>
<tr>
<td>GSS initiate failed</td>
<td>Authentication of credentials failed. Usually authentication failure is because reverse DNS is improperly configured. Add the KDC host to /etc/hosts on the Avamar server.</td>
</tr>
<tr>
<td>Cannot get kdc for realm</td>
<td>The KDC is improperly configured in the krb5.conf file.</td>
</tr>
<tr>
<td>Domain &lt;domain&gt; exists in ldap.properties file</td>
<td>The specified domain is in the ldap.properties file already.</td>
</tr>
</tbody>
</table>

### Adding an LDAP map

Create an LDAP map to associate the directory service group to Avamar user information. An LDAP map is a database construct that ties a group of users to an authentication system, domain or subdomain access list, and role.

#### Before you begin
Add directory service domains to the Avamar configuration.

#### Procedure
1. In Avamar Administrator, click the Administration launcher button. The Administration window appears.
2. Click the Account Management tab.
3. Click the LDAP Maps tab.
4. In the left-pane hierarchical tree, select a domain or a subdomain to specify the access level of the directory service group.
5. Select Actions › Account Management › New LDAP Map. The New LDAP Group Map dialog box appears.
6. From the LDAP Domains list, select a directory service domain to map.
7. In the Group Search box, type a search string specific to the group being mapped. You can use an asterisk (*) as a wildcard that represents one or more alphanumeric characters.

8. Click Search.
   The Directory Service Authentication dialog box appears.

9. Specify the authentication information required for querying the directory service. Authentication can be through a domain different from the one being mapped, as long as there is a trust relationship between the two domains.
   a. From the Auth Domain list, select a domain to use for authentication.
   b. In the User Name box, type a username for an account that has Read privileges for the domain.
   c. In the Password box, type the password for the username.
   d. Click OK.

   The Directory Service Authentication dialog box closes and the search starts. The Search button on the New LDAP Group Map dialog box changes to Stop.
   To terminate a search, click Stop. Searching a directory service can take a long time.
   The search is complete when groups appear in the LDAP Groups list.

10. From the LDAP Groups list, select the group to map.
11. From the Role list, select a role for the group.
12. Click OK.

   The group is mapped and the New LDAP Group Map dialog closes. Select the appropriate administrative node to see the mapping on the LDAP Maps tab.

### Editing the role for an LDAP map

**Procedure**

1. In Avamar Administrator, click the Administration launcher button.
   The Administration window appears.
2. Click the Account Management tab.
3. Click the LDAP Maps tab.
4. In the left-pane hierarchical tree, select a domain or a subdomain.
   The maps for the domain or subdomain appear in the LDAP Maps area.
5. Select the map to edit.
   The Edit LDAP Map dialog appears.
7. In Role, select a new role to assign to the map.
8. Click OK.

   The map is assigned the new role. Group members are assigned the new role in all subsequent sessions.
Deleting an LDAP map

Procedure
1. In Avamar Administrator, click the Administration launcher button. The Administration window appears.
2. Click the Account Management tab.
3. Click the LDAP Maps tab.
4. In the left-pane hierarchical tree, select a domain or a subdomain. The maps for the domain or subdomain appear in the LDAP Maps area.
5. Select the map to delete.
7. Click Yes.

Editing the time-out value for directory service processes

Directory service processes wait as long as five minutes for a response from the directory service. After this time period, the attempt is discarded and a time-out message appears. You can edit the time-out value.

The time-out value is used by the following directory service authentication processes:
- Authentication requests through the directory service
- Addition of a directory service to the Avamar configuration
- Testing of a directory service in the Avamar configuration

Procedure
1. Open a command shell and log in by using one of the following methods:
   - For a single-node server, log in to the server as admin.
   - For a multi-node server:
     a. Log in to the utility node as admin.
     b. Load the admin OpenSSH key by typing:
        
        ```
        ssh-agent
        ssh-add ~admin/.ssh/admin_key
        ```
     c. When prompted, type the admin_key passphrase and press Enter.
2. Stop the Management Console Server (mcs) service by typing `dpnctl stop mcs`.
3. Change the working directory by typing the following command:
   ```
   cd /usr/local/avamar/var/mc/server_data/prefs
   ```
4. Open `mcserver.xml` in a text editor.
5. Find the `<node name="ldap">` node.
6. Change the value of `<entry key="ldap_services_timeout_seconds" value="n" />` to a new time-out value in seconds, where $n$ is the new value.
   The default value is 300 seconds (five minutes).
7. Save the change and close the file.
8. Start the MCS and the scheduler by typing:

```bash
dpnctl start mcs
dpnctl start sched
```

9. Close the command shell.

### Enabling backward compatibility with Enterprise Authentication

To continue to authenticate users through the deprecated Enterprise Authentication mechanism enable the capability.

With Enterprise Authentication, Avamar uses the Pluggable Authentication Module (PAM) library of the host Linux operating system to provide access to external authentication databases. Enterprise Authentication, which is described in the *EMC Avamar Product Security Guide*, is deprecated and will be removed in future releases. By default, you cannot select an Enterprise Authentication domain when you add a user to a domain or client. To continue to use Enterprise Authentication as an authentication mechanism, configure the system to enable selection of Enterprise Authentication when adding a user by changing the Enterprise Authentication selection setting in `mcserver.xml`.

**Procedure**

1. Open a command shell and log in by using one of the following methods:
   - For a single-node server, log in to the server as admin.
   - For a multi-node server:
     a. Log in to the utility node as admin.
     b. Load the admin OpenSSH key by typing:
        ```bash
        ssh-agent bash
        ssh-add ~admin/.ssh/admin_key
        ```
     c. When prompted, type the `admin_key` passphrase and press Enter.
2. Stop the Management Console Server (mcs) service by typing `dpnctl stop mcs`.
3. Change the working directory by typing the following command:

```bash
cd /usr/local/avamar/var/mc/server_data/prefs
```
4. Open `mcserver.xml` in a text editor.
5. Find the `<node name="ldap">` node.
6. Change the value of `<entry key="enable_new_user_authentication_selection" value="false" />` from `false` to `true`.
7. Save the change and close the file.
8. Start the MCS and the scheduler by typing:

```bash
dpnctl start mcs
dpnctl start sched
```
9. Close the command shell.
Roles

Roles define the allowable operations for each user account.

There are three types of roles:

- Administrator roles
- Operator roles
- User roles

Administrator roles

Administrators are responsible for maintaining the system.

You can only assign the role of administrator to user accounts at a domain level. Domain level includes the top-level (root) domain and any other domain or subdomain. You cannot assign the administrator role to user accounts at a client level.

You can assign the administrator role to users at the top-level (root) domain or to a specific domain or subdomain.

Table 23 Administrator roles

<table>
<thead>
<tr>
<th>Administrator type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Root administrators</td>
<td>Administrators at the top-level (root) domain have full control of the system. They are sometimes referred to as “root administrators.”</td>
</tr>
<tr>
<td>Domain administrators</td>
<td>Administrators at domains other than root generally have access to most of the features that are described in this guide. Administrators typically can only view or operate on objects in the domain. Any activity that would allow a domain administrator to view data outside the domain is disallowed. Access to server features of a global nature (for example, suspending or resuming scheduled operations or changing runtimes for maintenance activities) is disallowed. Domain administrators:</td>
</tr>
<tr>
<td></td>
<td>- Cannot add or edit other subdomain administrators.</td>
</tr>
<tr>
<td></td>
<td>- Cannot change their assigned role.</td>
</tr>
<tr>
<td></td>
<td>- Can change their password.</td>
</tr>
</tbody>
</table>

Operator roles

Operator roles are generally implemented to allow certain users limited access to certain areas of the system to perform backups and restores, or obtain status and run reports. These roles allow greater freedom in assigning backup, restore, and reporting tasks to persons other than administrators.

You can only assign operator roles to user accounts at the domain level. You cannot assign these roles to user accounts at the client level. To add the user account to subdomains, you must have administrator privileges on the parent domain or above.

Users with an operator role do not have access to all features in Avamar Administrator. Instead, after login, they are presented with a single window that provides access to the features that they are allowed to use.

The following table describes the four operator roles.
### Table 24 Operator roles

<table>
<thead>
<tr>
<th>Operator type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Restore only operator</td>
<td>Restore only operators are generally only allowed to perform restores and to monitor those activities to determine when they complete and if they completed without errors. Restore only operators at the top-level (root) domain can perform restores for any client in the system. Restore only operators at a domain other than root can only perform restores for clients in that domain. Restore only operators can restore backup data and monitor activities in the assigned domain. By default, restore only operators cannot browse backups from the command line or the Avamar Web Restore interface. To enable these activities for a restore only operator, add the <code>noticketrequired</code> privilege by using the <code>avmgr chgv</code> command: <code>avmgr chgv --acct=location --u=name --ud=auth \ --pv=&quot;enabled,read,mclogin,noticketrequired&quot;</code> where <code>location</code> is the subdomain of the operator, <code>name</code> is the Avamar username of the user, and <code>auth</code> is the external authentication system used to authenticate the user.</td>
</tr>
<tr>
<td>Back up only operator</td>
<td>Back up only operators are generally only allowed to perform backups and to monitor those activities to determine when they complete and if they completed without errors. Back up only operators at the top-level (root) domain can perform backups for any client or group in the system. Back up only operators at domains other than root can only perform backups for clients or groups in that domain. Back up only operators can perform on-demand backups of a client or a group, as well as monitor activities in the assigned domain. By default, back up only operators cannot perform backups from the command line. To enable command line backups for a back up only operator, add the <code>noticketrequired</code> privilege by using the <code>avmgr chgv</code> command: <code>avmgr chgv --acct=location --u=name --ud=auth \ --pv=&quot;enabled,read,mclogin,backup,noticketrequired&quot;</code> where <code>location</code> is the subdomain of the operator, <code>name</code> is the Avamar username of the user, and <code>auth</code> is the external authentication system used to authenticate the user.</td>
</tr>
</tbody>
</table>
| Back up/restore operator | Back up/restore operators are generally only allowed to perform backups or restores and to monitor those activities to determine when they complete and if they completed without errors. As with roles assigned to other domain user accounts, back up/restore operators at the top-level (root) domain can perform backups and restores for any client or group in the system. Back up/restore operators at domains other than root can only perform backups and restores for clients or groups in that domain. Back up/restore operators can perform the following tasks in the assigned domain:  
  - Perform on-demand backups for a client or group.  
  - Perform restores.  
  - Monitor activities.  
  
  By default, back up/restore operators cannot browse backups from the command line or by using the Avamar Web Restore interface, and cannot perform backups from the command line. To enable these activities, add the `noticketrequired` privilege by using the `avmgr chgv` command: `avmgr chgv --acct=location --u=name --ud=auth \ --pv="enabled,read,mclogin,backup,noticketrequired"` where `location` is the subdomain of the operator, `name` is the Avamar username of the user, and `auth` is the external authentication system used to authenticate the user. |
| Activity operator       | Activity operators are generally only allowed to monitor backup and restore activities and to create certain reports. Activity operators at the top-level (root) domain can view or create reports for backup and restore activities in all domains and subdomains. Activity operators at domains other than root can only view or create reports for backup and restore activities in that domain. Activity operators can perform the following tasks in the assigned domain:  
  - Monitor activities.  
  - View the group status summary.  
  - View the Activity Report. |
<table>
<thead>
<tr>
<th>Operator type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>View the Replication Report.</td>
<td></td>
</tr>
</tbody>
</table>

**User roles**

User roles limit the operations that are allowed for a user account to a specific client. Users who are assigned to one of the user roles cannot log in to Avamar Administrator, Avamar Client Manager, or the Avamar client web UI.

The following table describes the four user roles.

<table>
<thead>
<tr>
<th>User type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Back Up Only User</td>
<td>Users assigned this role can start backups directly from the client by using the <code>avtar</code> command line.</td>
</tr>
<tr>
<td>Restore (Read) Only User</td>
<td>Users assigned this role can start restores directly from the client by using the <code>avtar</code> command line or MCS web services.</td>
</tr>
<tr>
<td>Back Up/Restore User</td>
<td>Users assigned this role can start backups and restores directly from the client by using the <code>avtar</code> command line or MCS web services.</td>
</tr>
</tbody>
</table>
| Restore (Read) Only/Ignore File Permissions    | Similar to the Restore (Read) Only User role except that operating system file permissions are ignored during restores. This user is allowed to restore any file that is stored for an Avamar client. This role is only available when users are authenticated by using Avamar internal authentication. To ensure trouble-free restores, Windows client user accounts should be assigned this role only when both of the following are true:  
  • Users are authenticated using Avamar internal authentication.  
  • Users do not require access to the Avamar client web UI. |

**Adding a user to a client or domain**

You can add a user account to a client or domain when the user account is authenticated by using Avamar internal authentication or the deprecated enterprise authentication system.

Preparation to use LDAP directory service authentication on page 65 provides details on adding a user that uses an existing directory service for authentication.

Procedure

1. Review Roles on page 81 to ensure that you will assign the correct role to this user.
2. In Avamar Administrator, click the Administration launcher button. The Administration window appears.
3. Click the Account Management tab.
4. Click the Users tab
5. In the left-pane hierarchical tree, select the domain or client for the new user.
You cannot add user accounts to the MC_RETIRED domain or to clients in the MC_RETIRED domain.

6. From the Actions menu, select Account Management > New User(s).
   The New User(s) dialog box appears.

7. (Optional) From the Authentication System list, select an authentication system.
   The Authentication System list normally appears in a dimmed state, with Axion Authentication System (the internal system) selected. This indicates that the ability to select an enterprise authentication system is not currently enabled.
   The enterprise authentication system, which is described in the EMC Avamar Product Security Guide, is deprecated and will be removed in future releases. However it can be used with this release. To enable the ability to select an enterprise authentication system, complete the procedure described in Enabling backward compatibility with Enterprise Authentication on page 80.
   For a more robust alternative to enterprise authentication, use the method described in Preparing to use LDAP directory service authentication on page 65.

8. (Optional) If you select the enterprise authentication system, select the Everyone option to designate roles for all users on this client or domain.

9. Select the User Name option and type the new username.
   The username must meet the following requirements:
   • If you use enterprise authentication, this must be the username assigned by that system.
   • The username cannot contain more than 31 characters.
   • The username cannot contain any of the following characters: ~!@$^%(){}[]\`|\;,:*?<>"'&.

10. From the Role list, select a role for the user.

11. In the Password box, type a password for the user.
   Passwords are case-sensitive and must meet the following requirements:
   • The password must be between six and 31 characters in length.
   • The password must contain only alphanumeric, hyphen, period, or underscore characters.
   • The password must contain at least one alphabetic character.
   This field is not used with enterprise authentication.

12. In the Confirm box, retype the password.
   This field is not used with enterprise authentication.

13. Click OK.
   A confirmation message appears.

14. Click OK.
Editing user information

Procedure

1. In Avamar Administrator, click the Administration launcher button.  
   The Administration window appears.
2. Click the Account Management tab.  
   In the Account Management tree, the icons for the clients indicate status. An x  
   appears for disabled clients, a question mark appears for unregistered clients, and  
   there is no special icon designation for active clients.
3. In the left-pane hierarchical tree, select the domain or client with the user.
4. Select the user.
5. From the Actions menu, select Account Management > Edit User.  
   The Edit User dialog box appears.
6. Select the role for the user.
7. (Optional) Change the password for the user:
   a. Click Set Password.  
      The Set Password dialog box appears.
   b. Type the new password into both the New Password and Confirm Password boxes.
   c. Click OK on the Set Password dialog box.
8. Click OK.  
   A confirmation message appears.
9. Click OK.

Deleting a user

Procedure

1. In Avamar Administrator, click the Administration launcher button.  
   The Administration window appears.
2. Click the Account Management tab.
3. In the left-pane hierarchical tree, select the domain or client with the user.
4. Select the user.
5. From the Actions menu, select Account Management > Delete User.  
   A confirmation message appears.
6. Click Yes.  
   A second confirmation message appears.
7. Click OK.
CHAPTER 5

Backup

This chapter includes the following topics:

- Performing on-demand backups ................................................................. 88
- Scheduling backups ...................................................................................... 89
- Monitoring backups ..................................................................................... 114
- Canceling backups ...................................................................................... 114
- Managing completed backups ...................................................................... 115
Performing on-demand backups

You can perform an on-demand backup of an individual client. If you configure scheduled backups for a group of clients, then you can also perform an on-demand backup of a group or an on-demand backup of a single client by using group policy settings.

An on-demand backup is a one-time backup of data on an Avamar client computer. You may want to perform an on-demand backup for the first backup of the client immediately after you install the Avamar client software. You should also perform an on-demand backup before system maintenance, software installations, or software upgrades.

Performing an on-demand backup of a client

Procedure

1. In Avamar Administrator, click the **Backup & Restore** launcher button.
   The **Backup, Restore and Manage** window appears.

2. In the domain tree, select the domain for the client.

3. From the list of clients, select the client computer to back up.
   You can only view clients in the domain for the login account. To view all clients, log in to the root domain.

4. Click the **Backup** tab.
   A list of plug-ins on the client appears in the left pane of the **Backup** tab.

5. Browse to and select the checkbox next to the data to back up.

6. If you browse the client file system, specify a valid client username and password, then click **OK**.
   The username and password must have read permissions on the files and directories that you select for backup.

7. (Optional) To view a summary of all directories and files that you selected for backup, select **Actions** > **Preview List**.

8. Select **Actions** > **Back Up Now**.
   The **On Demand Backup Options** dialog box appears.

9. Select the backup retention setting:
   - To automatically delete this backup from the Avamar server after a specific amount of time, select **Retention period** and then specify the number of days, weeks, months, or years for the retention period.
   - To automatically delete this backup from the Avamar server on a specific calendar date, select **End date** and browse to that date on the calendar.
   - To keep this backup for as long as this client remains active in the Avamar server, select **No end date**.

10. From the **Avamar encryption method** list, select the encryption method to use for data transfer between the client and the Avamar server during the backup.
    The encryption technology and bit strength for a client/server connection depends on several factors, including the client operating system and Avamar server version. The *EMC Avamar Product Security Guide* provides additional information.

11. Click **More Options**.
Performing an on-demand group backup

On-demand group backups enable you to back up an entire group of clients, or an individual client with group policy settings at some time other than the regularly scheduled time.

While you can perform individual on-demand backups for each client, this can be time-consuming if there are many clients. Furthermore, you cannot manage on-demand backups by using advanced retention settings; they can only be assigned a static expiration date. Instead, you can perform an on-demand group backup, which may take less time and also enables you to manage the backups using advanced retention settings.

Procedure
1. In Avamar Administrator, click the Policy launcher button.
   The Policy window appears.
2. Click the Policy Management tab.
3. Select the group or client to back up:
   • To back up a group, click the Groups tab and then select the group from the list.
   • To back up a client, click the Clients tab and then select the client from the list.
4. Click the Back Up.
5. Click OK on the confirmation message.

Scheduling backups

Scheduled backups run automatically to ensure that backups occur on an ongoing basis. You can schedule backups to run daily, weekly, or monthly. The scheduled backup can include multiple clients or a single server.

Procedure
1. Create a dataset to define the data that is included in the backups.
2. Create a schedule for when the backups should occur.
3. Create a retention policy to define how long to keep the backups in the system.
4. Create a group for the backups.
   a. Assign the new dataset to the new group.
   b. Assign a schedule to the new group.
   c. Assign a retention policy to the new group.
d. Add one or more clients to the new group.

5. Enable scheduling for the group.

Datasets

When you perform an on-demand backup, the selection of directories and files in a client file system for the backup is valid only for that backup. In other words, it is not saved for future backups. An Avamar dataset is a list of directories and files to back up from a client. Assigning a dataset to a client or group enables you to save backup selections.

Each dataset defines:

- Source data list
- Exclusion list
- Inclusion list
- Plug-in options

**Source data list**

Dataset definitions start with a source data list that consists of:

- Data from one or more plug-ins
- A defined file system hierarchy, either the entire file system or selected directories, within each plug-in

**Exclusion and inclusion lists**

Datasets can also narrow the scope of the source data list by explicitly defining certain directories and file types to exclude or include in each backup.

Because default dataset behavior is to include everything in the source data list, the explicit exclusion and inclusion lists typically contain only a few entries.

When you specify exclusions and inclusions, case-sensitivity varies according to the target computing platform for the backup. Exclusions and inclusions for Windows platforms are not case-sensitive, while exclusions and inclusions for most other platforms are case-sensitive.

**NOTICE**

You cannot define inclusion and exclusion lists for several plug-ins, including the Exchange VSS plug-in, the SharePoint VSS plug-in, and VMware Image Backups.

**Processing relationship**

Avamar processes these dataset elements in the following order:

1. **Source data**—Source data from one or more plug-ins is defined. The default behavior is to include all data from all defined plug-ins.

2. **Exclusion list**—Next, the exclusion list is used to eliminate certain directories and file types from the dataset.

3. **Inclusion list**—Finally, the inclusion list is used to add back any files that were eliminated from the dataset in the exclusion list.

**Plug-in options**

Plug-in options enable you to further customize the behavior of a dataset. The user guide for each plug-in provides details on the options available for the plug-in.
Dataset catalog

The Avamar system includes a set of preconfigured datasets by default. You can use these datasets for scheduled backups of clients, or you can create a custom dataset.

**Base Dataset**
The Base Dataset defines a set of minimum, or baseline, backup requirements. The initial settings in the Base Dataset are:
- No source data plug-ins
- No explicit exclusion or inclusion list entries

This is essentially an empty dataset.

**Default Dataset**
The Default Dataset defines persistent backup selections for the Default Group. The initial settings in the Default Dataset are:
- All available source data plug-ins
- No explicit exclusion or inclusion list entries

This ensures that all members of the Default Group can back up their client computers regardless of platform type.

If you edit these settings, the changes are enforced on all members of the Default Group, unless you override the group settings and assign another dataset at the client level.

The directories listed in the following table are also inherently excluded from all backups, even though they do not explicitly appear in the exclusion list.

**Table 26 Directories excluded from Default Dataset backups**

<table>
<thead>
<tr>
<th>Exclusion</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>.snapshot/</td>
<td>NetApp mounts</td>
</tr>
<tr>
<td>VARDIR/f_cache.dat</td>
<td>Local avatar file cache</td>
</tr>
<tr>
<td>VARDIR/p_cache.dat</td>
<td>Local avatar &quot;is present&quot; cache</td>
</tr>
</tbody>
</table>

**Unix Dataset**
The Unix Dataset is optimized for use with AIX, FreeBSD, HP-UX, Linux, and Solaris clients. The initial settings in the Unix Dataset are:
- Only the AIX, FreeBSD, HP-UX, Linux, Macintosh OS X, and Solaris file system source data plug-ins
- Explicit exclusion of various temp directories (/tmp, /var/tmp, /usr/tmp), core dump files (core), and local cache files (*.cache.dat, *.scan.dat)
- No explicit inclusion list entries

The directories listed in the following table are also inherently excluded from all Unix Dataset backups, even though they do not explicitly appear in the exclusion list.

**Table 27 Directories excluded from Unix Dataset backups**

<table>
<thead>
<tr>
<th>Exclusion</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>.snapshot/</td>
<td>NetApp mounts</td>
</tr>
</tbody>
</table>
Table 27 Directories excluded from Unix Dataset backups  (continued)

<table>
<thead>
<tr>
<th>Exclusion</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VARDIR/f_cache.dat</td>
<td>Local avatar cache files</td>
</tr>
<tr>
<td>VARDIR/p_cache.dat</td>
<td>Local avatar cache files</td>
</tr>

<td>Pseudo file system that cannot be restored</td>
</tr>
<tr>
<td>/dev</td>
<td>Excluded only if not running as root</td>
</tr>
<tr>
<td>/devices</td>
<td>Excluded only for Solaris</td>
</tr>
</tbody>
</table>

Windows Dataset
The Windows Dataset is optimized for use with Microsoft Windows clients. The initial settings in the Windows Dataset are:

- Only Windows file system source data plug-in
- No explicit exclusion or inclusion list entries

The directories listed in the following table are also inherently excluded from all Windows Dataset backups, even though they do not explicitly appear in the exclusion list.

Table 28 Directories excluded from Windows Dataset backups

<table>
<thead>
<tr>
<th>Exclusion</th>
<th>Description</th>
</tr>
</thead>
<tbody>

<tr>
<td>outlook*.ost</td>
<td>Outlook local cache files</td>
</tr>
</tbody>
</table>

VMware Image Dataset
The VMware Image Dataset is the default dataset for protecting VMware entities with image backup. In many respects, the VMware Image Dataset is simpler than most other datasets:

- The only available source data plug-ins are Linux and Windows virtual disks, and both are selected by default.
- The Select Files and/or Folders option, as well as the Exclusions and Inclusions tabs, are disabled.
Change block tracking is enabled by default using an embedded
utilize_changed_block_list=true plug-in option statement.

The **EMC Avamar for VMware User Guide** provides details on using the VMware Image
Dataset to back up VMware entities.

Creating a dataset

**Procedure**

1. In Avamar Administrator, select **Tools > Manage Datasets.**
   The **Manage All Datasets** window appears.

2. Click **New.**
   The **New Dataset** dialog box appears.

3. In the **Name** box, type a name for the dataset.
   The name can include alphanumeric characters (A-Z, a-z, 0-9) and the following
   special characters: period (.), hyphen (-), and underscore (_). Do not use Unicode
   characters or the following special characters: ` ~ ! @ # $ % ^ & * ( ) = + [ ] { } | \ / ; : ' " < > , ?

4. Click the **Source Data** tab, and then define the source data plug-ins that contribute
data to this dataset.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Include data from all plug-ins on the client</td>
<td>Select <strong>Select All Data for All Local File Systems.</strong></td>
</tr>
</tbody>
</table>
| Include data only from a specific plug-in and limit the dataset to specific data | a. Select **Enter Explicitly.**  
   b. From the **Select Plug-In Type** list, select the plug-in to use for the backups.  
   Additional options may appear below the **Select Plug-In Type** list.  
   c. Select the option to back up all available data with the plug-in, or select **Select Files and/or Folders** and then browse to the data to include in the backups. |

**Note**

You can also type the path to the data to back up. **Typing the data path for a dataset on page 94** provides
guidelines for typing the path.

5. Click the **Exclusions** tab, and then define the data to exclude from the dataset:
   a. Select the plug-in that you are using for the backups from the **Select Plug-in Type** list.
   b. Type the path to the data to exclude, or click ... to browse to the data.
   c. Click +.
   d. Repeat these steps for each data path to exclude from the backups.
   Typical exclusion lists include /temp files and directories and UNIX core dumps.

6. Click the **Inclusions** tab, and then define the data to include in the dataset that otherwise would be excluded based on the selections on the **Exclusions** tab:
a. Select the plug-in that you are using for the backups from the **Select Plug-in Type** list.

b. Type the path to the data to include, or click ... to browse to the data.

c. Click +.

d. Repeat these steps for each data path to include in the backups.

7. Click the **Options** tab, and then set plug-in options either by using the graphical controls or by typing option names and values as text entries.

   The user guide for each plug-in provides details on the available options.

8. Click **OK**.

### Typing the data path for a dataset

You can limit scheduled backups to a set of data by specifying the path to the data in the dataset. You can browse to or type the path to the data. Several rules apply when you type the path.

#### Wildcards

If you are using a file system plug-in, then the first occurrence of an asterisk (*) in a path is treated as a folder wildcard. For example, to specify the **My Documents** folder for all users on a Windows computer, type `C:\Documents and Settings\*\My Documents`.

To specify the **Documents** folder for all users on a Macintosh, type `/Users/*/Documents`.

---

**NOTICE**

When you specify a data path, only the first occurrence of an asterisk is treated as a folder wildcard. Subsequent occurrences are interpreted literally.

---

**Supported characters in the data path**

The path can include alphanumerics (A-Z, a-z, 0-9) and an asterisk (*) as a wildcard. Do not use any of the following characters in the data path: `~!@#$%^()` {} [] | \ , ; `: * ? < > ' " &.

---

### Editing a dataset

**Procedure**

1. In Avamar Administrator, select **Tools > Manage Datasets**.

   The **Manage All Datasets** window appears.

2. Select a dataset and click **Edit**.

   The **Edit Dataset** dialog box appears.

3. Edit the dataset settings.

4. Click **OK**.

   Dataset changes take effect on the next scheduled backup. Backups that have already begun or have been completed are not affected.

### Copying a dataset

**Procedure**

1. In Avamar Administrator, select **Tools > Manage Datasets**.

   The **Manage All Datasets** window appears.
2. Select the dataset and click **Copy**. The **Save As** dialog box appears.
3. Type a name for the new dataset and click **OK**.

Deleting a dataset

**Before you begin**
Ensure that the dataset is not currently assigned to a client or group. You cannot delete a dataset if it is currently assigned to a client or group.

**Procedure**
1. In Avamar Administrator, select **Tools > Manage Datasets**. The **Manage All Datasets** window appears.
2. Select the dataset and click **Delete**.
3. Click **Yes** on the confirmation message.

Schedules

Schedules are reusable objects that control when group backups, custom event profile email notifications, and policy-based replication occur.

**Schedule types**
You can configure an Avamar schedule to repeat a system activity at one of the intervals that are listed in the following table.

**Table 29 Schedule types**

<table>
<thead>
<tr>
<th>Schedule type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Daily</td>
<td>Repeats a system activity every day at one or more times of the day. With daily schedules, you must also limit the duration of the activity to prevent job overlap.</td>
</tr>
<tr>
<td>Weekly</td>
<td>Repeats a system activity every week on one or more days of the week. With weekly schedules, you must also define the earliest start time for the activity, as well as the time at which the activity is stopped, even if it is still in progress.</td>
</tr>
<tr>
<td>Monthly</td>
<td>Repeats a system activity on a specific calendar date or on a designated day of the week each month, such as the first Sunday of every month. With monthly schedules, you must also define the earliest start time for the activity, as well as the time at which the activity is stopped, even if it is still in progress.</td>
</tr>
<tr>
<td>On-demand</td>
<td>Defines a schedule that does not run automatically. This option is useful for creating schedules that you can assign today but activate in the future. The option is also useful to create schedules that are assigned to groups that only perform on-demand backups, such as groups that contain only laptop clients.</td>
</tr>
</tbody>
</table>

**Schedule start time, end time, and duration**
When you create a schedule, you also define when the schedule should take effect, and when it should be discontinued. For example, assume that you know that the client computers used for a specific development project will be obsolete at a specific future date. You could create a schedule for those group backups that would automatically cease backups on a certain date. Similarly, if you are administering a large site, you could create schedules ahead of time, assign them to groups, and then activate them on a certain date. These group backups would not occur until the schedule took effect.
Because scheduled activities often straddle two calendar days, it is important to understand that Avamar allocates the full window of time to any activity started by a schedule. For example, consider a schedule with an earliest start time of 10 p.m., a latest end time of 6 a.m. (the following morning), and an end after date of December 31 of the current calendar year. On the evening of December 31, the activity starts as expected and runs until completed, typically sometime during the morning of January 1 the following year. However, beginning January 1, the schedule does not start any new scheduled activities.

The following figure illustrates how the start time, end time, and duration of a schedule interact with one another, using the initial settings of the Default schedule.

**Figure 10** Schedule start time, end time, and duration

![Schedule start time, end time, and duration](image)

This system activity begins at 10 p.m. (22:00), and can run until 6 a.m. (06:00) the next day, creating an effective eight hour duration.

In practice, scheduled activities rarely start or end precisely on time. Server load affects actual start times, and complexity of the activity affects actual end times. The complexity of the activity includes the amount of new client data that must be backed up, the number of group backups that are started, and the number of email messages that must be sent.

Specifying a schedule start time sets that time as the earliest point that the system activity can begin. Also, specifying a duration or end time establishes the latest possible end time for the system activity.

**Schedule time zones**

When you create or edit schedules, all times are shown relative to the local time zone for the Avamar Administrator client. For example, assume that you create a schedule in the Pacific Standard time zone with a next runtime of 10 p.m.. The next runtime for the schedule appears as 1 a.m. the following day (3 hours later) for an administrative user in the Eastern Standard time zone.

**Schedule catalog**

The Avamar system includes a set of preconfigured schedules by default. You can use these schedules or create a custom schedule.

The following schedules are available by default.

<table>
<thead>
<tr>
<th>Schedule name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Schedule</td>
<td>Controls backup scheduling for the Default Group. It is initially configured to run once per day at 10 p.m. If you edit these settings, the changes are enforced on all members of the Default Group.</td>
</tr>
<tr>
<td>Default Replication</td>
<td>Controls replication for replication groups.</td>
</tr>
<tr>
<td>Daily Schedule</td>
<td>Avamar supplies a predefined Daily Schedule.</td>
</tr>
</tbody>
</table>
Table 30 Schedule catalog (continued)

<table>
<thead>
<tr>
<th>Schedule name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Evaluation Schedule</td>
<td>Controls when the Evaluation Profile email notification is sent. It is initially configured to run every Monday at 6 a.m.</td>
</tr>
<tr>
<td>Notification Schedule</td>
<td>Controls when custom event profile email notification messages are sent.</td>
</tr>
<tr>
<td>Override Daily Schedule</td>
<td>Defines the available start times for clients that have the Override group schedules setting enabled. This schedule is editable. Copies of this schedule are not used with the Override group schedules setting.</td>
</tr>
<tr>
<td>Statistics Schedule</td>
<td>Controls how often various Avamar server statistics (for example, the Avamar server detail Bytes protected value) are retrieved or calculated. The default setting for this schedule is hourly.</td>
</tr>
</tbody>
</table>

Creating a schedule

Procedure

1. In Avamar Administrator, select Tools > Manage Schedules. The Manage All Schedules window appears.
2. Click New. The New Schedule dialog box appears.
3. In the Name box, type a name for the schedule. Do not use any of the following characters in the name: ~!@#$%^(){}[]\|,;`\:"'<>&.!
4. In the Repeat this schedule section, choose the schedule type:
   - Daily
   - Weekly
   - Monthly
   - On-Demand
5. Specify the schedule settings.
6. Ensure that the date and time listed next to Next Run Time near the top of the New Schedule dialog box are correct.
7. Click OK.

Schedule settings

The following table describes the schedule settings:
### Table 31 Settings for each type of schedule

<table>
<thead>
<tr>
<th>Schedule type</th>
<th>Settings</th>
</tr>
</thead>
</table>
| Daily         | 1. Use the **Select Daily Times** lists to specify the time of day at which the schedule should run, and then click **Add** to add the time to the Scheduled Times list.  
2. Repeat the previous step for each time at which the schedule should run each day.  
3. (Optional) To remove a time from the **Scheduled Times** list, select the time and click **Remove**.  
4. Limit the duration of scheduled system activities to prevent job overlap by selecting a time limit from the **Limit each run to (hours)** list.  
5. From the **Delay until** list, select the date when the schedule should take effect. To make a schedule effective immediately, select the current date from the list.  
6. Choose when to discontinue the schedule:  
   - To enable a schedule to run indefinitely, select **No End Date**.  
   - To discontinue a schedule on a specific date, select **End after** and then select a date from the list. |
| Weekly        | 1. Select the checkbox next to the days of the week on which the schedule should run.  
2. Define the activity operating hours by using the **Earliest start time** and **End no later than** boxes. You can type the times, or select the time and use the arrow buttons to change the times.  
   - The server workload affects the start time for an activity. Also, the first time that a backup is performed for any client, the backup is allowed to continue past the specified end time. This behavior is permitted because initial backups can take longer than subsequent backups of the same client.  
3. From the **Delay until** list, select the date when the schedule should take effect. To make a schedule effective immediately, select the current date from the list.  
4. Choose when to discontinue the schedule:  
   - To enable a schedule to run indefinitely, select **No End Date**.  
   - To discontinue a schedule on a specific date, select **End after** and then select a date from the list. |
| Monthly       | 1. Choose whether to repeat the activity on a specific calendar date or on a designated day of the week each month:  
   - To repeat the activity on a specific calendar date, select **Day of every month**, and then select the day from the list.  
   - To repeat the activity on a designated day of the week each month, select **The ... of every month** and then select the day from the lists.  
2. Define the activity operating hours by using the **Earliest start time** and **End no later than** boxes. You can type the times, or select the time and use the arrow buttons to change the times. |

</tbody>
</table>

Editing a schedule

**Procedure**

1. In Avamar Administrator, select **Tools > Manage Schedules**.
   
   The **Manage All Schedules** window appears.

2. Select a schedule and click **Edit**.
   
   The **Edit Schedule** dialog box appears.

3. Edit the schedule settings.

4. Click **OK**.

Editing the start times for client overrides of group schedules

When you allow users to override group backup schedules by using the web UI, you must configure the start times that are available for clients to use. To configure the start times, add entries to the Override Daily Schedule.

Access to the web UI is part of the enhanced features for enterprise desktop and laptop computers.

**Procedure**

1. In Avamar Administrator, select **Tools > Manage Schedules**.
   
   The **Manage All Schedules** window appears.

2. From the list of schedules, select **Override Daily Schedule** and click **Edit**.
   
   The **Edit Schedule** dialog box appears.

3. Use the **Select Daily Times** lists to specify a time of day to add to the selection list available to users on the web UI, and then click **Add** to add the time to the **Scheduled Times** list.
   
   To remove a time from the **Scheduled Times** list, select the time and click **Remove**.

4. Repeat the previous step to add time entries to the selection list available to users.
5. Limit the duration of scheduled system activities to prevent job overlap by selecting a time limit from the Limit each run to (hours) list.
6. Click OK.

Copying a schedule

Procedure
1. In Avamar Administrator, select Tools > Manage Schedules.
   The Manage All Schedules window appears.
2. Select the schedule and click Copy.
   The Save As dialog box appears.
3. Type a name for the new schedule and click OK.

Running a schedule on-demand

You can initiate scheduled operations immediately on an on-demand basis. The scheduler does not need to be running when you run a schedule on-demand.

Procedure
1. In Avamar Administrator, select Tools > Manage Schedules.
   The Manage All Schedules window appears.
2. Select a schedule and click Run Now.

Deleting a schedule

Before you begin
Ensure that the schedule is not currently assigned to a group. You cannot delete a schedule if it is currently assigned to a group.

Procedure
1. In Avamar Administrator, select Tools > Manage Schedules.
   The Manage All Schedules window appears.
2. Select the schedule and click Delete.
3. Click Yes on the confirmation message.

Retention policies

Backup retention policies enable you to specify how long to keep a backup in the system. A retention policy is assigned to each backup when the backup occurs. Specify a custom retention policy when you perform an on-demand backup, or create a retention policy that is assigned automatically to a group of clients during a scheduled backup.

When the retention for a backup expires, then the backup is automatically marked for deletion. The deletion occurs in batches during times of low system activity.

If required, you can manually change the retention setting for an individual backup that has already occurred. Changing the retention type for a backup on page 117 provides instructions. If you change a configured retention policy, however, the change applies only to backups that occur after the change. The retention setting remains the same for backups that have already been performed. Therefore, it is important to consider and implement the best retention policy for a site before too many backups occur.

There are two types of retention settings:
• Basic retention settings specify a fixed expiration date.
• Advanced retention settings specify the number of daily, weekly, monthly, and yearly backups to keep.

**Basic retention settings**
Basic retention settings are used to assign a fixed expiration date to a backup using one of the settings in the following table.

**Table 32 Basic retention settings**

<table>
<thead>
<tr>
<th>Retention setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Retention period</td>
<td>Enables you to define a fixed retention period in days, weeks, months, or years after the backup is performed. For example, you could specify that backups expire after 6 months.</td>
</tr>
<tr>
<td>End date</td>
<td>Enables you to assign a calendar date as the expiration date. For example, you could specify that backups expire on December 31, 2013.</td>
</tr>
<tr>
<td>No end date</td>
<td>Enables you to keep backups indefinitely. This setting is useful for ensuring that all backups that are assigned this retention policy are retained for the life of the system.</td>
</tr>
</tbody>
</table>

**NOTICE**
For backups of 32-bit Windows or 32-bit Linux client computers, do not assign a retention period for a date after February 7, 2106. If you assign an extended retention period to a 32-bit Windows client, the backup completes with exceptions. For 32-bit Linux clients, the backups complete but do not appear in Avamar Administrator.

**Advanced retention settings**
With advanced retention settings, it is possible to assign the expiration of backups dynamically by using the number of daily backups, weekly backups, monthly backups, and yearly backups to retain in the system.

For scheduled daily backups, some backups are automatically assigned an advanced retention type:
• The first successful scheduled backup each day is designated as the daily backup.
• The first successful scheduled backup each week is designated as the weekly backup.
• The first successful scheduled backup each month is designated as the monthly backup.
• The first successful scheduled backup each year is designated as the yearly backup.

For assigning advanced retention types, each day begins at 00:00:01 GMT, each week begins on Sunday, each month begins on the first calendar day of that month, and each year begins on January 1.

**NOTICE**
You cannot apply advanced retention settings to on-demand backups. On-demand backups can occur at any time, and are therefore inherently asynchronous—the system cannot tag them as daily, weekly, monthly, or yearly.

Always use daily scheduled backups with retention policies with advanced retention settings. The reason for this is that the **Always keep: n weeks of daily backups** setting...
has no effect unless there are daily backups in the system. Depending on the schedule you use, daily backups may not be in the system. For example, if you assign a schedule to a group that only performs weekly backups, then there are no daily backups in the system.

Retention policy catalog

The Avamar system includes a set of preconfigured retention policies by default. You can use these retention policies for scheduled backups of clients, or you can create a custom retention policy.

The retention policies in the following table are available by default.

**Table 33 Retention policy catalog**

<table>
<thead>
<tr>
<th>Retention policy name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Minimal Retention</td>
<td>Enables you to enforce a minimum basic retention setting across an entire site. For example, you can keep all backups for at least 90 days regardless of what other retention policies specify. This feature is intended to address the need of some enterprises to enforce site-wide minimum retention standards regardless of what individual organizations might decide to implement with other retention policies. The Minimal Retention policy is a global system object that controls only the minimal retention setting. Therefore, you cannot assign the Minimal Retention policy to a group.</td>
</tr>
<tr>
<td>Default Retention</td>
<td>Defines backup retention settings for the Default Group. By default, the Default Retention policy assigns a retention period of 60 days and retains 60 days of daily backups.</td>
</tr>
<tr>
<td>End User On Demand Retention</td>
<td>Controls the retention settings for on-demand backups initiated by the client, such as when you use the Back Up Now command on the Avamar Windows client. Advanced retention settings are disabled on this retention policy because advanced retention settings never apply to on-demand backups. The End User On Demand Retention policy is a global system object that only controls retention for on-demand backups initiated by the client. Therefore, you cannot assign the End User On Demand Retention policy to a group.</td>
</tr>
<tr>
<td>Monthly Retention policy</td>
<td>Sets the expiration date to one month after the backup is performed.</td>
</tr>
<tr>
<td>Weekly Retention policy</td>
<td>Sets the expiration date to one week after the backup is performed.</td>
</tr>
</tbody>
</table>

Creating a retention policy

**Procedure**

1. In Avamar Administrator, select *Tools > Manage Retention Policies.*
   
   The **Manage All Retention Policies** window appears.

2. Click *New.*
   
   The **New Retention Policy** dialog box appears.

3. In the **Name** box, type a name for the retention policy.
   
   Do not use any of the following characters in the retention policy name: ~!@#$%^(){}[]";:\"*/?<>"&.
4. Complete the steps for either basic retention settings or advanced retention settings.

<table>
<thead>
<tr>
<th>Retention setting</th>
<th>Steps</th>
</tr>
</thead>
<tbody>
<tr>
<td>Basic</td>
<td>Select one of the following settings:</td>
</tr>
<tr>
<td></td>
<td>• To delete backups automatically after a specific number of days, weeks, months, or years, select <strong>Retention period</strong> and specify the number of days, weeks, months, or years.</td>
</tr>
<tr>
<td></td>
<td>• To delete backups automatically on a specific calendar date, select <strong>End date</strong> and then browse to that date on the calendar.</td>
</tr>
<tr>
<td></td>
<td>• To keep backups for the period that a client is active, select <strong>No end date</strong>.</td>
</tr>
<tr>
<td></td>
<td>The best practice is to specify a retention that is greater than or equal to 14 days. When you create a retention policy for less than 14 days, an alert appears.</td>
</tr>
<tr>
<td>Advanced</td>
<td>a. Select <strong>Override basic retention policy for scheduled backups</strong>.</td>
</tr>
<tr>
<td></td>
<td>b. Click <strong>Advanced</strong>.</td>
</tr>
<tr>
<td></td>
<td>The <strong>Edit Advanced Retention Policy</strong> dialog box appears.</td>
</tr>
<tr>
<td></td>
<td>c. Specify the maximum number of daily, weekly, monthly, and yearly backups to retain.</td>
</tr>
<tr>
<td></td>
<td>d. Click <strong>OK</strong> on the <strong>Edit Advanced Retention Policy</strong> dialog box.</td>
</tr>
</tbody>
</table>

5. Click **OK** on the **New Retention Policy** dialog box.

**Editing a retention policy**

**Procedure**

1. In Avamar Administrator, select **Tools > Manage Retention Policies**. The **Manage All Retention Policies** window appears.
2. Select a retention policy and click **Edit**. The **Edit Retention Policy** dialog box appears.
3. Edit the retention policy settings. Click **OK**.

**Copying a retention policy**

**Procedure**

1. In Avamar Administrator, select **Tools > Manage Retention Policies**. The **Manage All Retention Policies** window appears.
2. Select a retention policy and click **Copy**. The **Save As** dialog box appears.
3. Type a name for the new retention policy and click **OK**.
Deleting a retention policy

Before you begin
Ensure that the retention policy is not currently assigned to a client or group. You cannot delete a retention policy if it is currently assigned to a client or group.

Procedure
1. In Avamar Administrator, select Tools > Manage Retention Policies.
   The Manage All Retention Policies window appears.
2. Select the retention policy and click Delete.
3. Click Yes on the confirmation message.

Enforcing a minimum retention setting

Minimal retention enables you to enforce a minimum basic retention setting across an entire site. For example, you can keep all backups for at least 90 days regardless of what other retention policies specify.

This feature is intended to address the need of some enterprises to enforce site-wide minimum retention standards regardless of what individual organizations might decide to implement with other retention policies.

To enforce minimal retention, enable and configure the Minimal Retention policy, which is a default retention policy in the system. The Minimal Retention policy is a global system object that controls only the minimal retention setting. Therefore, you cannot assign the Minimal Retention policy to a group.

Procedure
1. In Avamar Administrator, select Tools > Manage Retention Policies.
   The Manage All Retention Policies window appears.
2. Select the Minimal Retention policy and click Edit.
   The Edit Retention Policy dialog box appears.
3. Select Retention period.
4. Specify the number of days, weeks, months, or years to ensure that backups are retained.
5. Click OK.

Automatically retaining the last backup

To retain the last backup of all clients, even after the backup exceeds its retention period, enable last backup retention. Last backup retention changes the default retention behavior for client backups that occur after it is enabled. With last backup retention, the last backup of a client is not marked for deletion when its retention period expires. Instead, the latest backup is the “last backup” and the previous “last backup” expires or is retained according to its retention policy.

Last backup retention is designed for clients that do not back up frequently. For those clients, the default behavior can lead to the last backup expiring before a new backup occurs and clients that do not have an available backup.

Clients that are not permanently connected to a domain, such as remote desktops and laptops, may encounter this situation more frequently than clients that have uninterrupted server access.
When you enable last backup retention, Avamar retains a single backup for each client, even if you perform multiple types of backups of a client. For example, if you perform both file system and application backups of a client, and the file system backup is the last backup, then all application backups can expire.

Procedure
1. Open a command shell and log in by using one of the following methods:
   - For a single-node server, log in to the server as admin.
   - For a multi-node server:
     a. Log in to the utility node as admin.
     b. Load the admin OpenSSH key by typing:
        
        ```
        ssh-agent bash
        ssh-add ~admin/.ssh/admin_key
        ```
     c. When prompted, type the `admin_key` passphrase and press Enter.
2. Change directories by typing:
   
   ```
   cd /usr/local/avamar/var/mc/server_data/prefs
   ```
3. Open `mcserver.xml` in a text editor.
4. Find the `dpn` node.
5. In the `dpn` node, change the value of the `keep_last_backup` entry key from `false` to `true`.
6. Save the change and close the text editor.
7. Stop and restart the MCS, and start the scheduler by typing the following commands:
   
   ```
   dpnctl stop mcs
   dpnctl start mcs
   dpnctl start sched
   ```
8. Close the command shell.

Groups

Avamar uses groups to implement various policies to automate backups and enforce consistent rules and system behavior across an entire segment, or group, of the user community.

Group members
Group members are client machines that have been added to a particular group for the purposes of performing scheduled backups. Because the normal rules for domain administrators apply, these clients must be located within the same domain or within a subdomain of where the group exists.

Group policy
When you create a group, you specify the dataset, schedule, and retention policy for the group. These three objects comprise the group policy. The group policy controls backup behavior for all members of the group.
You can override group dataset and retention policy settings for a client by making explicit dataset or retention policy assignments for the client. However, schedules apply only to groups, not individual clients.

**Default Group**
The Avamar system includes a Default Group. In the default Avamar server configuration, the Default Group always uses the system default dataset, schedule, and retention policy. You cannot change these system default assignments. However, you can edit the settings within the system default dataset, schedule, and retention policy.

If you do not create any other groups, then new clients are automatically added to the Default Group.

**VMware groups**
The following table describes the special groups that apply to VMware environments.

<table>
<thead>
<tr>
<th>Group</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Proxy Group</td>
<td>The Default Proxy Group is the default group for VMware Image Proxy clients. You cannot delete the Default Proxy Group. Enabling the Default Proxy Group does not conflict with scheduled backups performed by other plug-ins configured on the proxy client.</td>
</tr>
<tr>
<td>Default Virtual Machine Group</td>
<td>New virtual machine clients are automatically added to the Default Virtual Machine Group when they are registered. You cannot manually delete the Default Virtual Machine Group, but it is automatically deleted if you delete the vCenter domain.</td>
</tr>
<tr>
<td>VM Backup Validation groups</td>
<td>VM Backup Validation groups are used to implement the restore rehearsal feature for VMware virtual machines.</td>
</tr>
</tbody>
</table>

The *EMC Avamar for VMware User Guide* provides additional details on each of these groups.

**Creating a group**

When you create a group, you define the dataset, schedule, and retention policy, which together comprise the group policy for scheduled backups of all members of the group. A group must contain at least one Avamar client. If the group contains two or more clients, then the clients must belong to the same Avamar domain. You can override group policy settings at the client level.

**Before you begin**

You cannot edit schedules or retention policies when you use the New Group wizard to create a group. Review existing schedules and retention policies. If required, create new ones before you create the group.

**Procedure**

1. In Avamar Administrator, click the Policy launcher button.
   The Policy window appears.
2. Click the Policy Management tab.
3. Click the Groups tab.
4. Select the domain for the group.
   The Policy window displays a table that contains groups for the domain.
5. Select **Actions** > **Group** > **New** > **Backup Group**.

   The **New Group** wizard appears.

6. Type a name for the new group in the **Name** box.

   The name can include alphanumeric characters (A-Z, a-z, 0-9) and the following special characters: period (.), hyphen (-), and underscore (_). Do not use Unicode characters or the following special characters: ' ~ ! @ # $ % ^ & * ( ) = + \[ \] { } | \ / ; : ' " < > , ?

7. Clear the **Disabled** checkbox to use this group for scheduled client backups.

   Selecting the checkbox disables backups for the group.

8. From the **Avamar encryption method** list, select an encryption method to use for data transfer between the Avamar server and the client during the backup.

   The encryption technology and bit strength for a client/server connection depends on several factors, including the client operating system and Avamar server version. The *EMC Avamar Product Security Guide* provides additional information.

9. (Optional) Select **Override Schedule** to override the assigned schedule for this group:

   - To skip the next scheduled backup, select **Skip Next Backup**.
   - To perform the next scheduled backup one time only, select **Run Next Backup Once**.

10. Click **Next**.

    The next **New Group** wizard page appears with dataset information.

11. From the **Select An Existing Dataset** list, select the dataset that you created, and then click **Next**.

    The next **New Group** wizard page appears with schedule information.

12. Select a schedule from the **Select An Existing Schedule** list, and click **Next**.

    The next **New Group** wizard page appears with retention policy information.

13. Select a retention policy from the **Select an Existing Retention Policy** list, and click **Next**.

    The final **New Group** wizard page appears. A list of domains appears in the **Choose Domain** pane.

14. Select the domain for the client.

    A list of Avamar clients appears in the pane below the **Choose Domain** pane.

15. Select the checkbox next to the clients to include in the group.

    The clients appear in the **Members** pane.

16. (Optional) To remove a client from the group, select the client from the **Members** list, and then click the red **X**.

17. Click **Finish**.

Managing group membership

You can manage group membership in Avamar Administrator either by adding or removing members for a group or adding or removing groups to which a client belongs.

The method that you use to manage group membership depends on the situation. For example, if you are adding or deleting multiple clients from a single group, then the
group-centric method is efficient. Conversely, if you are adding or removing a single client from multiple groups, then the client-centric method is most efficient.

**Editing membership for a group**

**Procedure**
1. In Avamar Administrator, click the **Policy** launcher button.
   The **Policy** window appears.
2. Click the **Policy Management** tab.
3. Click the **Groups** tab.
4. Select the group.
5. Select **Actions** > **Group** > **Edit Group**.
   The **Edit Group** dialog box appears.
6. Click the **Members** tab.
7. Complete the steps to add or remove members for the group.

<table>
<thead>
<tr>
<th>Task</th>
<th>Steps</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add members to the group</td>
<td>Select the checkboxes next to the clients to add.</td>
</tr>
<tr>
<td>Remove members from the group</td>
<td>Select the clients to remove and click X.</td>
</tr>
<tr>
<td>Move members to another group</td>
<td>Select the client from the Member(s) list and click Move. In the Move Group Members dialog box, select the new group for the client and click OK.</td>
</tr>
</tbody>
</table>

8. Click **OK**.

**Editing the groups for a client**

**Procedure**
1. In Avamar Administrator, click the **Policy** launcher button.
   The **Policy** window appears.
2. Click the **Policy Management** tab.
3. Click the **Clients** tab.
4. Select the client to edit.
5. Select **Actions** > **Group** > **Edit Client**.
   The **Edit Client** dialog box appears.
6. Click the **Groups** tab.
7. Add and remove groups for the client:
   - To add groups, click **Add**, select the groups, and then click **OK**.
   - To remove groups, select the groups from which to remove the client, and click **Remove**.
8. Click **OK**.
Monitoring groups

You can monitor groups by using the Group Summary Reports and Group Status Summary.

Procedure

- To view the Group Summary Reports, click the Policy launcher button in Avamar Administrator, and then click the Group Summary Reports tab on the Policy window.

  The Group Summary Reports are a combined “at a glance” view of all current group properties and settings, including group policy overrides. The reports also display the datasets, schedules, and retention policies assigned to various groups.

- To view the Group Status Summary, click the Activity launcher button in Avamar Administrator, and then click the Group Status Summary tab on the Activity window.

  The Group Status Summary is a simplified presentation of all backup activity initiated as a result of group policies, including the total number of backups initiated by way of the group policy, as well as the number of active, successfully completed, canceled, and failed backups.

Editing group properties

You can edit properties for a single group or for multiple groups. When you select multiple groups, you cannot edit all group properties.

The Default Proxy Group and the Default Virtual Machine Group contain special settings that are only of interest to persons managing the VMware Image backup and restore feature. The EMC Avamar for VMware User Guide provides details on these settings.

Procedure

1. In Avamar Administrator, click the Policy launcher button.

   The Policy window appears.

2. Click the Policy Management tab.

3. Click the Groups tab.

4. Select one or more groups to edit.

5. Select Actions > Group > Edit Group.

   If you selected a single group, then the Edit Group dialog box appears. If you selected multiple groups, then the Edit Multiple Groups dialog box appears.

6. Edit the group information:

   - When you edit a single group, you can edit only basic group properties, such as the name, client list, and the dataset, schedule, and retention policy that are assigned to the group. You cannot edit the settings for the assigned dataset, schedule, and retention policy.

   - When you edit the Default Group, you cannot edit Default Group policy object assignments. The Default Group always uses the default dataset, default schedule, and default retention policy. Therefore, the Dataset, Schedule, and Retention Policy tabs do not appear when you edit the Default Group.

   - When you edit multiple groups, select the new settings from the lists, or select Don’t Change to leave a setting unchanged for the selected groups. You can edit only basic group properties, such as whether the group is enabled or disabled, the encryption setting, and the dataset, schedule, and retention policy that are
assigned to the groups. You cannot edit the settings for the assigned dataset, schedule, and retention policy.

7. Click OK.

Copying a group

You must copy groups within the same domain. You cannot copy a group to another domain.

**Procedure**

1. In Avamar Administrator, click the **Policy** launcher button.
   
   The **Policy** window appears.
2. Click the **Policy Management** tab.
3. Click the **Groups** tab.
4. Select the group to copy.
5. Select **Actions > Group > Copy Group**.
   
   The **Save As** dialog box appears.
6. Type a name for the new group.
7. Select the **Include Client Members** to copy the entire client list to this new group.
8. Click OK.

Enabling and disabling a group

You can disable a group to prevent scheduled backups from occurring for the group. This is typically done to place the system in a state that supports various maintenance activities.

If you disable a group, you must re-enable the group to resume scheduled group backups.

**Procedure**

1. In Avamar Administrator, click the **Policy** launcher button.
   
   The **Policy** window appears.
2. Click the **Policy Management** tab.
3. Click the **Groups** tab.
4. Select the group to enable or disable.
5. Right-click the group and select **Disable Group**.
   
   If the group is disabled, this action clears the checkmark and enables the group. If the group is enabled, this action sets the checkmark and disables the group.
6. Click **Yes**.

Deleting a group

**Before you begin**

Assign the clients in the group to a different group so that scheduled backups for the clients can continue uninterrupted.

**Procedure**

1. In Avamar Administrator, click the **Policy** launcher button.
   
   The **Policy** window appears.
2. Click the **Policy Management** tab.
3. Click the **Groups** tab.
4. Select the group to delete.
5. Select **Actions > Group > Delete Group**.
6. Click **Yes** on the confirmation message.
   A second confirmation message appears.
7. Click **OK**.

### Overriding group policy settings for a client

Override group policy settings for a single client, including the dataset, schedule, and encryption method for client/server data transfers. Allow users to start on-demand backups from the client by using the Avamar client web UI, or specify a maximum size in MB for backups from the client.

**NOTICE**

Too many overrides can make group policies less effective. Instead, implement a new group policy rather than repeatedly overriding an existing policy at the client level.

#### Procedure

1. In Avamar Administrator, click the **Policy** launcher button.
   The **Policy** window appears.
2. Click the **Policy Management** tab.
3. Click the **Clients** tab.
4. In the left pane, select the domain for the client.
5. In the right pane, select the client.
6. Click **Edit**.
   The **Edit Client** window appears.
7. Click the **Properties** tab.
8. To allow users on the client to start on-demand backups, select **Allow client initiated backups**.
   If no additional configuration is performed, backups started from the client include only those files that the user selects. Also, End User On-Demand Retention is applied. However, you can enforce the use of a particular dataset and retention policy for all client-initiated backups.
9. To allow users to create sets of folders and files to back up through an on-demand backup by using the Avamar client web UI, select **Allow file selection on client initiated backups**.
   When this feature is enabled, users can:
   - Specify the folders and files to include in a backup set.
   - Create multiple backup sets.
   - Save backup sets for reuse.
   - Perform an on-demand backup of the folders and files in the backup sets they create.
**NOTICE**

Folders and files that are selected through this feature are not subject to group dataset source limits, exclusions, or inclusions. Also, this feature does not affect automatic backup of clients according to their group policies.

---

**Note**

Windows, Mac, and Linux clients that use the desktop and laptop client enhancements require an additional configuration step to enable this setting. *Allowing users to create on-demand backup sets on page 334* provides more information.

---

10. Choose whether to override the group schedule duration setting for a client by selecting a value from the **Overtime** list:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>No overtime allowed</td>
<td>Scheduled group backups are never allowed to run past the schedule duration setting.</td>
</tr>
<tr>
<td>Overtime on next backup only</td>
<td>Only the next scheduled group backup is allowed to run past the schedule duration setting.</td>
</tr>
<tr>
<td>Overtime until successful backup</td>
<td>Scheduled group backups are allowed to run past the schedule duration setting until a successful backup completes.</td>
</tr>
<tr>
<td>Always allow overtime</td>
<td>Scheduled group backups are always allowed to run past the schedule duration setting.</td>
</tr>
</tbody>
</table>

11. Select **Override group encryption to**, and then select the encryption setting to use for client/server data transfer for the client.

The encryption technology and bit strength for a client/server connection depends on several factors, including the client operating system and Avamar server version. The *EMC Avamar Product Security Guide* provides details.

12. To allow users in the Avamar client web UI to select a different backup start time for daily backups from a list of available times that you specify, select **Allow override of group’s daily schedule**.

*Editing the start times for client overrides of group schedules on page 99* provides more information on specifying the list of available times.

13. To specify a maximum allowed size in MB for the client’s backups, type an integer between 1 and 99999 in **Hard limit (MB)**.

Backups from the client that exceed that size are canceled. The Activity Report entry for the backup displays True in the hard_limit_exceeded column, and the status entry Hard limit exceeded appears in the Activity Monitor.

14. To specify a maximum size in MB beyond which the client’s backups are flagged for excessive size, type an integer between 1 and 99999 in **Soft limit (MB)**.

Backups from the client that exceed that size are allowed, but the Activity Report entry for the client’s backup displays True in the soft_limit_exceeded column, and the status entry Completed appears in the Activity Monitor.

15. If you allow users on the client to start on-demand backups, select the retention policy for all client-initiated backups:
a. Click the **Retention Policy** tab.

b. Choose whether to use the group retention policy or a different retention policy for all client-initiated backups by selecting or clearing the **Override group retention policy** checkbox. Clear the checkbox to use the retention policy that is assigned to the group, or select the checkbox to use a different retention policy.

c. If you select the checkbox to use a different retention policy, select the **Override retention policy on client initiated backups** checkbox, and then select the retention policy from the **Select an Existing Retention Policy** list.

16. To assign separate override datasets for each group in which the client is a member:
   a. Click the **Groups** tab.
   b. For each group in which the client is a member, select a dataset from the list in the **Override Dataset** column.

17. To allow users to use the Avamar client web UI to add folders to the source data for the group datasets that are assigned to the users’ clients, click the **Dataset Additions** tab and then select **Allow additions to source data**.

   The Avamar system includes the selected folders in every automatic and on-demand backup for every group that is assigned to the client, and group exclusion and inclusion lists are applied to the added data.

18. Click **OK**.

**Overriding group policy settings for multiple clients**

You can override group policy settings for multiple clients at a time, including the encryption method, whether backups can run beyond the schedule end time, and whether users on the client can initiate on-demand backups and select a different backup start time.

**Procedure**

1. In Avamar Administrator, click the Policy launcher button.

   The Policy window appears.

2. Click the **Policy Management** tab.

3. Click the **Clients** tab.

4. Select the clients.

5. Click **Edit**.

   The **Edit Multiple Clients** dialog box appears.

6. Select an override value from the list, and select **Apply the change**.

   **Overriding group policy settings for a client on page 111** provides more information on each of the settings.

7. Click **OK**.

**Enabling scheduled backups**

Scheduled backups occur only for enabled groups. Groups are disabled by default unless you select the **Enabled** checkbox on the first page of the **New Group** wizard. If you did not
enable the group when you created it, use the menu options in the Policy window to enable backups.

Procedure
1. In Avamar Administrator, click the Policy launcher button. The Policy window appears.
2. Click the Policy Management tab.
3. Click the Groups tab.
4. Select the group that you created.
5. Enable the group by selecting Actions > Group > Disable Group.
   Perform this step only if a check mark appears next to the Disable Group menu option.
6. Click Yes to enable this group.

Monitoring backups
You can monitor backups to ensure that the backups complete successfully and to troubleshoot issues. The Activity Monitor in Avamar Administrator enables you to view status information for both on-demand and scheduled backups.

Procedure
1. In Avamar Administrator, click the Activity launcher button. The Activity window appears.
2. Click the Activity Monitor tab. A list of all activities appears.
3. To filter the results to display only backup activity, select Actions > Filter. The Filter Activity dialog box appears.
4. Select All Backups from the Type list.
5. Click OK.

Canceling backups
You can cancel a backup any time before it completes. The cancellation might take five minutes or longer. The backup may complete before the cancellation finishes.

Procedure
1. In Avamar Administrator, click the Activity launcher button. The Activity window appears.
2. Click the Activity Monitor tab. A list of all activities appears.
3. Select the backup from the list.
4. Select Actions > Cancel Activity. A confirmation message appears.
5. Click Yes.
Managing completed backups

After you perform an on-demand or scheduled backup, you can validate the backup, change settings for the backup, or delete the backup.

Finding a completed backup to manage

You can find a completed backup by searching for a backup that occurred on a specific calendar date or during a specific date range, or by searching for a backup with a specific retention type.

NOTICE

Avamar generally supports the use of specific supported international characters in directory, folder, and filenames. However, proper display of international language characters is contingent on the client computer’s Java locale and installed system fonts being compatible with the original language. If you browse backups that were created with international characters and a compatible font is not installed, then any characters that cannot be resolved by the system appear as rectangles. This is a normal limitation of that particular situation and does not affect the ability to restore these directories, folders, or files. The EMC Avamar Release Notes provide additional international language support information.

Procedure

1. In Avamar Administrator, click the Backup & Restore launcher button. The Backup, Restore and Manage window appears.
2. In the clients tree, browse to and select the client with the backups to manage.
3. Click the Manage tab.
4. Complete the steps to find the backup either by date, date range, or retention type.

<table>
<thead>
<tr>
<th>Search method</th>
<th>Steps</th>
</tr>
</thead>
</table>
| By date                | a. Select By day.  
b. Select the backup date from the calendar. Valid backups occurred on dates with a yellow highlight. |
| By date range          | a. Select By date range.  
b. Click the From Date list, and browse the calendar for the start date for the range.  
c. Click the To Date list, and browse the calendar for the end date for the range.  
d. Click Retrieve. |
| By retention type      | a. Select By retention.  
b. Select the checkbox next to the retention type for the backup.  
c. Click Retrieve. |

A list of backups on that date, within that date range, or with the retention type appears in the Backup History list.
Validating a backup

You can verify that files can be restored from a backup. This validation starts a “virtual” restore of all files in the backup, but does not actually restore any files to the client file system.

Procedure

1. In Avamar Administrator, click the Backup & Restore launcher button. The Backup, Restore and Manage window appears.
2. Find the backup. Finding a completed backup to manage on page 115 provides instructions.
3. In the Backup History list, select the backup to validate.
4. Select Actions > Validate Backup.
   The Select Client to Perform Validation dialog box appears.
5. Select the client on which to validate the backup:
   • To validate the backup on the same client from which the backup was originally performed, select Validate using the backup client.
   • To validate the backup on a different client, select Validate using a different client, and then click Browse to browse to the client.
6. From the Validation Plug-in Type list, select the plug-in on which to validate the backup. Only the plug-ins that are installed on the selected client appear in the list.
7. From the Avamar encryption method list, select the encryption method to use for client/server data transfer during the validation.

   Note
   The default encryption setting for backup validations is high, regardless of the encryption setting that is used for the original backup.

8. Click OK.
   A confirmation message appears.
9. Click OK.

After you finish
Backup validations appear as activities in the Activity window. You can monitor and cancel the backup validation activity the same way that you monitor or cancel a backup. Monitoring backups on page 114 and Canceling backups on page 114 provide instructions.

Changing the expiration date for a backup

You can change the date that a backup expires. When the backup expires, Avamar users cannot recover data from the expired backup. A garbage collection process runs on a nightly basis to clean up and reclaim space from orphaned data (data that is unique to the expired backups).

The expiration date can be a specific date that you select or a retention period of a certain number of days, weeks, months, or years. You also can configure a backup to remain in backup storage for as long as the client remains active on the Avamar server.
Procedure

1. In Avamar Administrator, click the Backup & Restore launcher button.
   The Backup, Restore and Manage window appears.
2. Find the backup. Finding a completed backup to manage on page 115 provides instructions.
3. In the Backup History list, select the backup to manage. To select multiple backups, press Ctrl while you select the backups.
4. Select Actions > Change Expiration Date.
   The Change Expiration Date dialog box appears.
5. Select the new expiration date:
   - To automatically delete this backup from the Avamar server after a specific amount of time, select Retention period and then specify the number of days, weeks, months, or years for the retention period.
   - To automatically delete this backup from the Avamar server on a specific calendar date, select End date and browse to that date on the calendar.
   - To keep this backup for as long as this client remains active in the Avamar server, select No end date.
6. Click OK.
   A confirmation message appears.
7. Click Yes.
   An event code dialog box appears.
8. Click OK.
9. Click OK on the confirmation message.

Changing the retention type for a backup

To support certain advanced features, Avamar Administrator automatically assigns one or more retention types to every backup. For example, the first backup created on an Avamar system is tagged as a daily, weekly, monthly, or yearly. You can manually change the retention types assigned to a backup.

When you manually change the retention types assigned to a backup, especially one that has multiple retention types, be certain that you are not inadvertently removing a weekly, monthly, or yearly backup that you need to retain. For example, consider a backup that is assigned daily, weekly, monthly, and yearly retention types. If you remove the yearly retention type designation, you might not have another yearly backup in the system for quite a long time.

Procedure

1. In Avamar Administrator, click the Backup & Restore launcher button.
   The Backup, Restore and Manage window appears.
2. Find the backup. Finding a completed backup to manage on page 115 provides instructions.
3. In the Backup History list, select the backup to manage. To select multiple backups, press Ctrl while you select the backups.
4. Select Actions > Change Retention Type.
   The Change Retention Type dialog box appears.
5. Select one of the following retention types for the backups:
   - To explicitly assign a daily, weekly, monthly or yearly retention type to this backup, select Tags and then select the checkbox next to the retention types.
   - If you do not want to explicitly assign a daily, weekly, monthly, or yearly retention type to the backup, select Not tagged. The backup is designated as untagged.

6. Click OK.
   A confirmation message appears.

7. Click Yes.
   A second confirmation message appears.

8. Click OK.

**Viewing backup statistics**

You can view detailed statistics for completed backups from both the Activity window and the Manage tab of the Backup, Restore and Manage window.

The Manage tab of the Backup, Restore and Manage window provides statistics for any stored backup. The Activity window shows only recent backup activity. Typically, only the backups within the past 72 hours appear in the Activity window.

The same statistics appear for each backup, regardless of whether you view the statistics from the Backup, Restore and Manage window or the Activity window.

**Procedure**

1. Complete the steps to find the backup in either the Backup, Restore and Manage window or the Activity window.

<table>
<thead>
<tr>
<th>Window</th>
<th>Steps</th>
</tr>
</thead>
</table>
| Backup, Restore and Manage window | a. In Avamar Administrator, click the Backup & Restore launcher button.  
                                         The Backup, Restore and Manage window appears.  
                                         b. Find the backup. Finding a completed backup to manage on page 115 provides instructions.  
                                         c. In the Backup History list, select the backup. |
| Activity window               | a. In Avamar Administrator, click the Activity launcher button.  
                                         The Activity window appears.  
                                         b. Click the Activity Monitor tab.  
                                         c. Select a backup activity from the list. |

2. Select Actions > View Statistics.
   The Backup Statistics dialog box appears.

3. (Optional) To export the data on a tab of the Backup Statistics dialog box to a comma-separated values (.csv) file, click Export and then specify the location and file name for the file.

4. Click Close.

**Information in the backup statistics dialog box**

The following information is available on the tabs of the Backup Statistics dialog box.
Table 35 Backup statistics dialog box information

<table>
<thead>
<tr>

Deleting a backup

When you delete a backup, Avamar immediately and permanently deletes all data in that backup from the server.

Procedure

1. In Avamar Administrator, click the **Backup & Restore** launcher button.
   
   The **Backup, Restore and Manage** window appears.

2. Find the backup to delete. *Finding a completed backup to manage on page 115 provides instructions.*

3. In the **Backup History** list, select the backup to delete.

4. Select **Actions**  >  **Delete Backup**.
   
   A confirmation message appears.

5. Click **OK**.
Backup
CHAPTER 6

Restore and Recovery

This chapter includes the following topics:

- Restoring data from a backup ................................................................. 122
- Monitoring restores ............................................................................. 128
- Canceling restores ............................................................................... 128
- Windows client system recovery ......................................................... 128
- Red Hat and CentOS Linux system recovery ....................................... 128
- SUSE Linux system recovery ............................................................... 135
- Oracle Solaris system recovery ............................................................ 142
Restoring data from a backup

You can find a backup to restore either by date or by the contents of the backup. When you perform the restore, you can restore to either the original location, a different location, or multiple locations.

**NOTICE**

The options for the restore destination depend on the plug-in type. For example, the SQL Server plug-in enables you to restore to a file instead of to SQL Server, and you cannot restore to multiple locations with the Oracle plug-in. The user guide for each plug-in provides details on the available options and how to perform each available type of restore.

Finding a backup

The first step to restore data is to find the backup with the data that you want to restore. You can find Avamar client backups by searching either for a specific date or for specific content.

Locate backups by date when one or more of the following situations apply:

- You save all data for the client in a single backup set.
- The exact pathname or name of the data to restore is unknown.
- The backup you want to restore is before a specific date or event. For example, you know the approximate date when data was lost or corrupted. You can search for a backup before that date.
- The specific types of backups are known. For example, you run scheduled disaster recovery backups every Wednesday and Saturday night, and you run full volume backups daily. When you need to rebuild a server, select the disaster recovery backup with the date closest to the event that caused the loss of data.

Locate backups by the content of the backup when one or more of the following situations apply:

- You back up data on the client in separate backup sets.
- You want to view multiple versions of the same file so that you can decide the version to restore.
- The date of the backup or the content of a backup is unknown, but you know the name of the data to restore.

**NOTICE**

Avamar generally supports the use of specific supported international characters in directory, folder, and filenames. However, proper display of international language characters is contingent on the client computer's Java locale and installed system fonts being compatible with the original language. If you browse backups that were created with international characters and a compatible font is not installed, then any characters that cannot be resolved by the system appear as rectangles. This is a normal limitation of that particular situation and does not affect the ability to restore these directories, folders, or files. The *EMC Avamar Release Notes* provide additional international language support information.
Replicas

When the Replicas at Source feature is enabled on the Avamar server, Avamar Administrator lists replicas on the Restore tab in the same table that lists backups. View and restore data from replicas through the Restore tab of Avamar Administrator. Replicas appear with the following information:

- **Remote** in the **Type** column
- **Name/IP address and system type of the remote destination system** in the **Server** column

**Note**

When Avamar Administrator lists data from a backup as both **Local** and **Remote**, the Avamar system always uses the local backup to restore the data. However, when backup data that is listed as **Remote** is selected for validation, the Avamar system stages and validates the referenced replica.

**Replicas at Source on page 225** provides additional information about the Replicas at Source feature.

Finding a backup by date

**Procedure**

1. In Avamar Administrator, click the **Backup & Restore** launcher button. The **Backup, Restore and Manage** window appears.

2. Click the **Restore** tab. The upper left pane contains a list of domains.

3. Select the domain that contains the client.

   You cannot view clients outside the domain for the login account. To view all clients, log in to the root domain.

   A list of Avamar clients appears in the pane under the domains list.

4. Select the client from the list.

5. Click the **By Date** tab.

6. Select the backup date from the calendar. Valid backups occurred on dates with a yellow highlight.

   A list of backups on that date appears in the **Backups** table next to the calendar.

7. Select the backup to restore from the **Backups** table.

8. Select the data to restore from the **Contents of Backup** pane at the bottom of the **Select for Restore** tab.

9. If you browse the client file system, specify a valid client username and password, then click **OK**.

   The username and password must have read permissions on the files and directories that you select for restore.

10. Select **Actions** > **Restore Now**.
Finding a backup by content

Procedure

1. In Avamar Administrator, click the Backup & Restore launcher button.
   The Backup, Restore and Manage window appears.
2. Click the Restore tab.
   The upper left pane contains a list of domains.
3. Select the domain that contains the client.
   You cannot view clients outside the domain for the login account. To view all clients, log in to the root domain.
   A list of Avamar clients appears in the pane under the domains list.
4. Select the client from the list.
5. Click the By File/Folder tab.
6. In the Enter path to retrieve history for text box, specify the pathname to the content by using one of the methods in the following table.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type the path</td>
<td>Type the full pathname to the content in the Enter path to retrieve history for box.</td>
</tr>
<tr>
<td>Browse</td>
<td>a. Click Browse. The Select File or Folder window appears.</td>
</tr>
<tr>
<td></td>
<td>b. Select the client.</td>
</tr>
<tr>
<td></td>
<td>c. Select the plug-in.</td>
</tr>
<tr>
<td></td>
<td>A list of folders appears in a table to the right of the plug-ins pane.</td>
</tr>
<tr>
<td></td>
<td>d. Select the content to restore.</td>
</tr>
<tr>
<td></td>
<td>e. Click OK. The selected content appears in the Enter path to retrieve history for box.</td>
</tr>
</tbody>
</table>

7. Click Retrieve.
   The Version History table lists all versions and sizes of the content in backups for the client.
8. Select the version in the Version History table.
   All backups for the client that contain the version appear in the Backups table next to the Version History table.
9. Select the data to restore from the Contents of Backup pane at the bottom of the Select for Restore tab.
10. If you browse the client file system, specify a valid client username and password, then click OK.
    The username and password must have read permissions on the files and directories that you select for restore.
11. Select Actions › Restore Now.
Restoring to the original location

Procedure

1. In Avamar Administrator, click the **Backup & Restore** launcher button.
   The **Backup, Restore and Manage** window appears.

2. Find the backup to restore:
   - **Finding a backup by date on page 123**
   - **Finding a backup by content on page 124**
   The backup to restore is selected in the **Backups** table.

3. Select **Actions** > **Restore Now**.
   The **Restore Options** dialog box appears.

4. Leave the default selection of the original client in the **Restore Destination Client** box.

5. Leave the default selection of the original backup plug-in in the **Restore Plug-in** list.

6. From the **Avamar encryption method** list, select an encryption method for client/server data transfers during this restore.

   **Note**

   The encryption technology and bit strength for a client/server connection depends on several factors, including the client operating system and Avamar server version. The **EMC Avamar Product Security Guide** provides details.

7. Select **Restore everything to its original location**.

8. To include plug-in options with this restore, click **More Options**, and then configure the settings. The user guide for each plug-in provides details on each plug-in option.

9. Click **OK** on the **Restore Options** dialog box.

10. Click **Close**.

Restoring to a different location

Procedure

1. In Avamar Administrator, click the **Backup & Restore** launcher button.
   The **Backup, Restore and Manage** window appears.

2. Find the backup to restore:
   - **Finding a backup by date on page 123**
   - **Finding a backup by content on page 124**
   The backup to restore is selected in the **Backups** table.

3. Select **Actions** > **Restore Now**.
   The **Restore Options** dialog box appears.

4. Select the destination client for the data to restore:
   - To restore to a different location on the same client, leave the default selection of the original client in the **Restore Destination Client** box.
   - To restore to a different client, click the **Browse** button next to the **Restore Destination Client** box, and then browse to and select the destination client.
5. Select the plug-in to use for the restore from the **Restore Plug-in** list.

6. From the **Avamar encryption method** list, select an encryption method for client/server data transfers during this restore.

   **Note**
   
   The encryption technology and bit strength for a client/server connection depends on several factors, including the client operating system and Avamar server version. The *EMC Avamar Product Security Guide* provides details.

7. Select **Restore everything to a different location**.

   **NOTICE**
   
   When you restore a single directory to a different location, Avamar restores only the contents of the directory. Avamar does not restore the original parent directory.

8. Select the destination directory on the client for the data to restore:
   
   a. Click **Set Destination** below the Items **Marked for Restore** list.
      
      The **Set Destination** dialog box appears.
      
      b. Type the path to the destination directory in the **Save Target(s) in Directory** box, or click **Browse** to browse to a directory.
         
         If you type a path and the directory does not already exist, then the restore process creates the directory.
      
      c. Click **OK** on the **Set Destination** dialog box.
         
         When a file with the same name already exists in the path to which you are restoring a file, use the **Overwrite Existing Files** option on the **Restore Command Line Options** dialog box to control whether the restore process overwrites the file.

9. To include plug-in options with this restore, click **More Options**, and then configure the settings. The user guide for each plug-in provides details on each plug-in option.

10. Click **OK** on the **Restore Options** dialog box.

11. Click **Close**.

### Restoring to multiple locations

You can restore backup data to multiple locations on a destination client.

**Procedure**

1. In Avamar Administrator, click the **Backup & Restore** launcher button.
   
   The **Backup, Restore and Manage** window appears.

2. Find the backup to restore:
   
   - **Finding a backup by date on page 123**
   - **Finding a backup by content on page 124**
      
      The backup to restore is selected in the **Backups** table.

3. Select **Actions > Restore Now**.
   
   The **Restore Options** dialog box appears.

4. Select the destination client for the data to restore:
To restore to multiple locations on the same client, leave the default selection of the original client in the Restore Destination Client box.

To restore to multiple locations on a different client, click the Browse button next to the Restore Destination Client box and then browse to and select the destination client.

5. Select the plug-in to use for the restore from the Restore Plug-in list.

6. From the Avamar encryption method list, select an encryption method for client/server data transfers during this restore.

Note

The encryption technology and bit strength for a client/server connection depends on several factors, including the client operating system and Avamar server version. The *EMC Avamar Product Security Guide* provides details.

7. Select Restore everything to multiple locations.

Notices

When you restore multiple directories to multiple locations, Avamar restores only the contents of the directory. Avamar does not restore the original parent directory.

8. Select the destination directories on the client for the data to restore:
   a. Click Set Destination below the Items Marked for Restore list.
      The Set Destination dialog box appears.
   b. Select a row in the list.
   c. Type the path to the destination directory in the Destination (Save As) column in the list, or click Browse to browse to a directory.
      If you type a path and the directory does not already exist, then the restore process creates the directory.
   d. Repeat the previous two steps for each row in the list on the Set Destination dialog box.
   e. Click OK on the Set Destination dialog box.
      When a file with the same name already exists in the path to which you are restoring a file, use the Overwrite Existing Files option on the Restore Command Line Options dialog box to control whether the restore process overwrites the file.

9. To include plug-in options with this restore, click More Options, and then configure the settings. The user guide for each plug-in provides details on each plug-in option.

10. Click OK on the Restore Options dialog box.

11. Click Close.
Monitoring restores

You can monitor restores to ensure that the restores complete successfully and to troubleshoot issues. The Activity Monitor in Avamar Administrator enables you to view status information for restores.

Procedure

1. In Avamar Administrator, click the Activity launcher button.
   The Activity window appears.
2. Click the Activity Monitor tab.
   A list of all activities appears.
3. To filter the results to display only restore activity, select Actions > Filter.
   The Filter Activity dialog box appears.
4. Select Restore from the Type list.
5. Click OK.

Canceling restores

You can cancel a restore any time before the restore completes. The cancellation might take five minutes or longer. The restore may complete before the cancellation finishes.

Procedure

1. In Avamar Administrator, click the Activity launcher button.
   The Activity window appears.
2. Click the Activity Monitor tab.
   A list of all activities appears.
3. Select the restore from the list.
4. Select Actions > Cancel Activity.
   A confirmation message appears.
5. Click Yes.

Windows client system recovery

Comprehensive details about the necessary backups for Windows client system recovery and the procedures to perform the recovery are available in the EMC Avamar for Windows Server User Guide.

Red Hat and CentOS Linux system recovery

The following topics describe how to restore a Red Hat or CentOS Linux client system to its original system state.

Reconstructing the partition table

Before you perform system recovery of a Linux client, you must reconstruct the partition table used in the original Avamar backup by running an avtar --showlog mounts
command on a temporary client computer, then examining the output to determine the
number and size of partitions to create when you install the operating system on the
target recovery client.

Procedure
1. Locate the backup to use for the system state recovery:
   a. In Avamar Administrator, click the Backup & Restore launcher button.
      The Backup, Restore and Manage window appears.
   b. Click the Restore tab.
   c. In the clients tree, select the original Linux client.
   d. Find the full system backup to use to recover the system state.
   e. Note the backup label number.
   f. Leave Avamar Administrator open for the remainder of the system state recovery
      procedure.
2. On a temporary client computer with network connectivity to the Avamar server, open
   a command shell and log in as root.
3. Type the following command:
   ```
   /usr/local/avamar/bin/avtar --avamaronly --showlog mounts --
   server=Avamar_server --id=username --ap=password --path=/domain/
   client --labelnumber=n
   ```
   where:
   - `Avamar_server` is the IP address or fully qualified hostname as defined in DNS for
     the Avamar server.
   - `username` and password are the login credentials for a user account with a
     sufficient role and privileges to perform a restore.
   - `/domain/client` is the full location of the original Linux client on the Avamar server.
   - `n` is the label number of the backup to use for the system state recovery.
4. Examine the command output to locate entries beginning with `mount_decision`.
   For example:
   ```
   mount_decision: reason="starting_point" fstype="ext3" path="/"
   mount_decision: reason="default_backup" fstype="ext3" path="/boot"
   mount_decision: reason="default_backup" fstype="ext3" path="/home"
   ```
   These are entries for the mount points on the original system. Earlier in the output,
   there are entries for each of these mount points. For example:
   ```
   mount: status="user_directed_backup" path="/" hdev="/dev/root" kind="ext3" blksize=4096 freeblks=1189334
   maxblks=2405872 freefiles=2259654 maxfiles=2432000 dev=2050
   mount: status="default_backup" path="/boot" hdev="/dev/sda1"
   kind="ext3" blksize=1024 freeblks=183371 maxblks=194442
   freefiles=50167 maxfiles=50200 dev=2049
   ```
mount: status="default_backup" path="/home" hdev="/dev/sdb1"
kind="ext3" blksize=4096 freeblks=1027161 maxblks=5158925
freefiles=2530548 maxfiles=2621440 dev=2065

These entries contain mount point size and path information.

5. Calculate the original file system size or each mount point in bytes by multiplying the `blksize` value by the `maxblks` value.

**NOTICE**

Multiplying the `blksize` value by the `maxblks` value calculates the free space used on the original device. However, you should create the root partition with an additional 2 GB to 3 GB of free space to ensure sufficient space for the minimal install used for the restore process.

6. Note which paths are mounted from separate file systems. This information is required later in the restore process.

**Preparing the target recovery client**

**Procedure**

1. Ensure that the recovery destination disk is connected to the target recovery client.
2. Perform a minimal installation of a compatible operating system. For the purposes of this procedure:
   - Minimal installation means that desktop environment entries such as Desktop - Gnome should not be selected for installation.
   - In the Customize Now dialog box Base System category, select the Base option. Leave all other options disabled.
   - Compatible operating system means the same version. For example, if the original client backup on the Avamar server was performed on an RHEL3 client, then install RHEL3 on the target recovery client.
   - Use the information that you gathered during Reconstructing the partition table on page 128 to create as many partitions as necessary to replicate the original configuration.
3. (Optional) Save a copy of the `/etc/fstab` file so that you can compare it to the restored `/etc/fstab` file.
4. Install the Avamar Client for Linux. The *EMC Avamar Backup Clients User Guide* provides instructions.

**Performing system recovery of a Red Hat or CentOS Linux client**

**Before you begin**

Perform the steps in Reconstructing the partition table on page 128 and Preparing the target recovery client on page 130.

**Procedure**

1. Start the recovery target client from the install media (first CD/DVD):
   - On Red Hat or CentOS 4 or 5, type `linux rescue` at the command prompt.
   - On Red Hat or CentOS 6.0 or later, select Rescue installed system.
2. Follow the onscreen instructions.
   Be sure to enable networking by providing IP address, network mask, default gateway, and DNS server values when prompted. You can use a temporary hostname and IP, or the original information from the computer that you are restoring.

3. Allow the installer to search for installations and mount the /mnt/sysimage file system as read/write.
   The /mnt/sysimage file system is the target of the restore, and is also referred to as the recovery destination disk.

   **Note**
   You cannot restore the root file system directly to /mnt/sysimage because there is no method to restrict the restore operation to only the local partition without traversing network mount points. Therefore, a restore directly to /mnt/sysimage might copy files from all the partitions, and /mnt/sysimage could fill up before all required files were restored.

4. Ensure that the following directories are all present in the `LD_LIBRARY_PATH` system variable:
   - /lib
   - /lib64
   - /usr/lib
   - /usr/lib64
   - /mnt/sysimage/lib
   - /mnt/sysimage/lib64
   - /mnt/sysimage/usr/local/avamar/lib

   If any directories are missing from `LD_LIBRARY_PATH`, add them.

5. Create a temporary /tmp/avtar.cmd flag file with a UNIX text editor. For example:

   ```
   cd /tmp
   vi avtar.cmd
   --bindir=/mnt/sysimage/usr/local/avamar/bin
   --vardir=/mnt/sysimage/usr/local/avamar/var
   --sysdir=/mnt/sysimage/usr/local/avamar/etc
   --server=Avamar_server
   --account=/domain/client
   --id=username
   --ap=password
   --target=.
   ```

   where:
   - `Avamar_server` is the Avamar server IP address or fully qualified hostname as defined in DNS.
   - `/domain/client` is the full location of the original Linux client on the Avamar server.
   - `username` and `password` are the login credentials for a user account with sufficient role and privileges to perform the restore.
6. Restore most of the directories that originally existed under root (/):

**NOTICE**

Do not restore files that are on file systems other than the root file system at this time. These directories and files are restored later in this procedure.

a. Create a temporary restore directory under the client `/mnt/sysimage` directory and change directory to it by typing commands similar to the following examples:

```bash
mkdir /mnt/sysimage/restore
cd /mnt/sysimage/restore
```

b. Restore the contents of the root file system from the backup by typing the following command on a single command line:

```bash
/mnt/sysimage/usr/local/avamar/bin/avtar.bin -x --flagfile=/tmp/avtar.cmd --labelnumber=n [--exclude=./boot --exclude=./home] /
```

where `n` is the label number of the backup to use for the system state recovery.

Use `--exclude=path` options to exclude paths that were identified as separate mount points. These directories and files are separately restored later in this procedure.

The first two `--exclude` options in the previous command are included as an example. Replace the values with options appropriate to the system that you are restoring. Specify exclude options relative to the root of the original backup. For example, `--exclude=./boot` instead of `--exclude=/boot`.

c. For each directory that was restored, delete the original directory from `/mnt/sysimage`, and move the restored directory from the `/mnt/sysimage/restore` directory to `/mnt/sysimage` by typing commands similar to the following examples:

```bash
rm -rf /mnt/sysimage/etc
mv /mnt/sysimage/restore/etc /mnt/sysimage/etc
```

d. Repeat the previous step for each directory that successfully restored to `/mnt/sysimage/restore`.

7. Restore individual files in the root (/) directory:

a. Change directory to `/mnt/sysimage/restore` by typing the following command:

```bash
cd /mnt/sysimage/restore
```

b. Restore the individual files in the root (/) directory by typing the following commands:

```bash
mv .//* /mnt/sysimage
mv ./.* /mnt/sysimage
```

8. Restore other mount points:

a. Check that file systems are mounted as expected by typing `df -h` at the command prompt.
b. Compare the output to the expected set of mounted file systems. If there are discrepancies, mount the devices onto the correct mount points.

c. Change directory to each mount point by typing a command similar to the following example:

```
cd /mnt/sysimage/home
```

d. Create a temporary restore directory, then change directory to it by typing commands similar to the following examples:

```
mkdir ./restore
cd ./restore
```

e. Restore the contents of the mount point by typing the following command:

```
/mnt/sysimage/usr/local/avamar/bin/avtar.bin -x --flagfile=/tmp/avtar.cmd --labelnumber=n/home
```

where \( n \) is the label number of the backup to use for the restore, and \( /home \) is an example mount point.

f. Return to the mount point directory, and delete all files except for the restore directory by typing commands similar to the following examples:

```
alias ls=/usr/bin/ls
cd /mnt/sysimage/home; rm -rf `ls --hide restore`
rm -rf ./.*
```

g. Change directory to the `restore` directory, then move the contents into the correct place in the mount point by typing the following command:

```
cd ./restore; mv `ls -A ./` ..
```

h. Remove the `restore` directory by typing the following commands:

```
cd ..
rmdir restore
```

i. Repeat steps d through i for each remaining mount point.

9. Perform final system checks:

a. Inspect `/mnt/sysimage/etc/fstab`, and verify that there are valid statements for each file system to be mounted on the new system.

There are three ways that devices might be listed in the `fstab` file: device path, volume label, and Universally Unique Identifier (UUID).

You can determine this information about the file systems by typing `/mnt/sysimage/lib/udev/vol_id device_path`, where `device_path` is the `/dev` path to the device.

If that program is not present on the system, type `/mnt/sysimage/sbin/blkid device_path`.

If you created partitions manually during the minimal system install, the device UUIDs might have changed. Update the device UUIDs in `/mnt/sysimage/etc/fstab`. If some volumes are missing expected labels, set the label by typing `/mnt/sysimage/sbin/e2label device_path label`. 
b. Re-examine the `fstab` carefully.

The restored system cannot start correctly if the `fstab` entries do not exactly match the storage device configuration, and the rescue system on the install media has difficulty discovering which file systems to mount to `/mnt/sysimage`.

**Note**

If you saved a reference copy of the `fstab` file when you were preparing the target client for recovery, then you can find the disk information in that file. For systems with few manual changes to the restored `fstab` file, it might be possible to use the reference `fstab` file instead of the restored copy of the file.

c. Verify that no more files are present in `/mnt/sysimage/restore` by typing the following command:

```
ls -al /mnt/sysimage/restore
```

d. If the directory is empty, remove it by typing the following command:

```
rmdir /mnt/sysimage/restore
```

e. If the command fails because the directory is not empty, then there might be directories that you failed to move in when you restored most of the directories in root `/`. Move the directories to the proper restore locations.

10. Exit the command shell and restart the system by typing `exit`.

    If you are rebooting a Red Hat or CentOS 6 system, a menu appears.

11. Select `reboot`, then `OK` and press `Enter`.

    The system restarts.

12. Eject the install media and start normally.

13. Confirm correct client operation.

### Troubleshooting system recovery of a Red Hat or CentOS Linux client

The following topics provide details on troubleshooting issues that may occur after you perform system recovery of a Red Hat or CentOS Linux client.

#### Troubleshooting a boot failure after system recovery

If the restored system does not boot at the end of the restore procedure, then the version of GRUB installed by the minimal OS might be too dissimilar to the version previously used on the machine. You must boot into the restore environment and reinstall GRUB.

**Procedure**

1. Boot into the restore environment by starting the client from the install media with the rescue option.

2. If the startup process cannot find the restored operating system, then its `fstab` is probably configured incorrectly. Mount the partitions manually, and correct the contents of the file.

3. Reinstall GRUB by typing the following commands:

```
chroot /mnt/sysimage
grub-install device
```

where `device` is the boot device (for example, `/dev/sda`).
4. Exit the chroot environment by typing `exit`.
5. Exit the command shell and restart the system by typing `exit`.
   If you are rebooting a Red Hat or CentOS 6 system, a menu appears.
6. Select `reboot`, then `OK` and press `Enter`.
   The system restarts.
7. Eject the install media and start normally.

Restoring network settings after system recovery of a Linux client
If the operating system detects that you have restored the system to new hardware, it might revert the network settings to defaults (for example, DHCP name resolution instead of static IP). You can recover the previous network settings by manually reconfiguring the settings.

To examine the previous settings, open the `.bak` files in `/etc/sysconfig/network-scripts` in a text editor. These files contain useful information, but should not be used in the current configuration in an unmodified form, since they include MAC address information from the previous hardware.

**SUSE Linux system recovery**

The following topics describe how to restore a SUSE Linux client system to its original system state.

**Reconstructing the partition table**
Before you perform system recovery of a Linux client, you must reconstruct the partition table used in the original Avamar backup by running an `avtar --showlog mounts` command on a temporary client computer, then examining the output to determine the number and size of partitions to create when you install the operating system on the target recovery client.

**Procedure**
1. Locate the backup to use for the system state recovery:
   a. In Avamar Administrator, click the `Backup & Restore` launcher button.
      The `Backup, Restore and Manage` window appears.
   b. Click the `Restore` tab.
   c. In the clients tree, select the original Linux client.
   d. Find the full system backup to use to recover the system state.
   e. Note the backup label number.
   f. Leave Avamar Administrator open for the remainder of the system state recovery procedure.
2. On a temporary client computer with network connectivity to the Avamar server, open a command shell and log in as root.
3. Type the following command:

```
/usr/local/avamar/bin/avtar --avamaronly --showlog mounts --server=Avamar_server --id=username --ap=password --path=/domain/client --labelnumber=n
```
where:

- **Avamar_server** is the IP address or fully qualified hostname as defined in DNS for the Avamar server.
- **username** and password are the login credentials for a user account with a sufficient role and privileges to perform a restore.
- **/domain/client** is the full location of the original Linux client on the Avamar server.
- **n** is the label number of the backup to use for the system state recovery.

4. Examine the command output to locate entries beginning with `mount_decision`. For example:

```bash
mount_decision: reason="starting_point" fstype="ext3" path="/"
mount_decision: reason="default_backup" fstype="ext3" path="/boot"
mount_decision: reason="default_backup" fstype="ext3" path="/home"
```

These are entries for the mount points on the original system. Earlier in the output, there are entries for each of these mount points. For example:

```bash
mount: status="user_directed_backup" path="/" hdev="/dev/root" kind="ext3" blksize=4096 freeblks=1189334 maxblks=2405872 freefiles=2259654 maxfiles=2432000 dev=2050
mount: status="default_backup" path="/boot" hdev="/dev/sda1" kind="ext3" blksize=1024 freeblks=183371 maxblks=194442 freefiles=50167 maxfiles=50200 dev=2049
mount: status="default_backup" path="/home" hdev="/dev/sdb1" kind="ext3" blksize=4096 freeblks=1027161 maxblks=5158925 freefiles=2530548 maxfiles=2621440 dev=2065
```

These entries contain mount point size and path information.

5. Calculate the original file system size or each mount point in bytes by multiplying the `blksize` value by the `maxblks` value.

**NOTICE**

Multiplying the `blksize` value by the `maxblks` value calculates the free space used on the original device. However, you should create the root partition with an additional 2 GB to 3 GB of free space to ensure sufficient space for the minimal install used for the restore process.

6. Note which paths are mounted from separate file systems. This information is required later in the restore process.

### Preparing the target recovery client

**Procedure**

1. Ensure that the recovery destination disk is connected to the target recovery client.

2. Perform a minimal installation of a compatible operating system. For the purposes of this procedure:
Performing system recovery of a SUSE Linux client

Before you begin
Perform the steps in Reconstructing the partition table on page 128 and Preparing the target recovery client on page 136.

Procedure

1. Start the recovery target client from the install media (first CD/DVD) and select Rescue System.
2. Open a command shell on the recovery target client and log in as root.
3. Mount the root partition that is created in the minimal install to /mnt by typing the following command:
   ```
   mount /dev/sda# /mnt
   ```
   where /dev/sda# is the device that contains the root file system. If the drive was configured to use Linux Logical Volume Management, then the root device might be in the form of /dev/VolGroup##/LogVol##.

4. Rebind the pseudo-file systems into the /mnt tree by typing the following commands:
   ```
   mount --rbind /proc /mnt/proc
   mount --rbind /sys /mnt/sys
   mount --rbind /dev /mnt/dev
   ```

5. Change the current file system root by typing the following command:
   ```
   chroot /mnt
   ```

6. Start the network as configured in the prerequisites by typing the following command:
   ```
   rcnetwork start
   ```

7. Mount the auto-mount file systems and verify that the correct file systems were mounted by typing the following command:
   ```
   mount -a;df -h
   ```

8. If any file systems are missing (for example, if /boot is not set to auto-mount), then manually mount them to the correct locations by using additional mount commands.
9. Exit the chroot environment by typing `exit`.

10. Copy the network name resolution file from the chroot environment into the working restore environment by typing the following command:

    `cp /mnt/etc/resolv.conf /etc/resolv.conf`

11. Ensure that the following directories are all present in the `LD_LIBRARY_PATH` system variable:

    - `/lib`
    - `/lib64`
    - `/usr/lib`
    - `/usr/lib64`
    - `/mnt/lib`
    - `/mnt/lib64`
    - `/mnt/usr/local/avamar/lib`

    If any directories are missing from `LD_LIBRARY_PATH`, add them.

12. Create a temporary `/tmp/avtar.cmd` flag file with a UNIX text editor. For example:

    ```
    cd /tmp
    vi avtar.cmd
    --bindir=/mnt/usr/local/avamar/bin
    --vardir=/mnt/usr/local/avamar/var
    --sysdir=/mnt/usr/local/avamar/etc
    --server=Avamar_server
    --account=/domain/client
    --id=username
    --ap=password
    --target=.
    ```

    where:

    - `Avamar_server` is the Avamar server IP address or fully qualified hostname as defined in DNS.
    - `/domain/client` is the full location of the original Linux client on the Avamar server.
    - `username` and `password` are the login credentials for a user account with sufficient role and privileges to perform the restore.

13. Restore most of the directories that originally existed under root (/):

    **NOTICE**

    Do not restore files that are on file systems other than the root file system at this time. These directories and files are restored later in this procedure.

    a. Create a temporary restore directory under the client `/mnt` directory and change directory to it by typing commands similar to the following examples:

    ```
    mkdir /mnt/restore
    cd /mnt/restore
    ```

    b. Restore the contents of the root file system from the backup by typing the following command on a single command line:
Performing system recovery of a SUSE Linux client

139

/raw/usr/local/avamar/bin/avtar.bin -x --flagfile=/tmp/avtar.cmd
--labelnumber=n [-exclude=./boot --exclude=./home] /

where \( n \) is the label number of the backup to use for the system state recovery.

Use --exclude=path options to exclude paths that were identified as separate mount points. These directories and files are separately restored later in this procedure.

The first two --exclude options in the previous command are included as an example. Replace the values with options appropriate to the system that you are restoring. Specify exclude options relative to the root of the original backup. For example, --exclude=./boot instead of --exclude=/boot.

c. For each directory that was restored, delete the original directory from /mnt, and move the restored directory from the /mnt/restore directory to /mnt by typing commands similar to the following examples:

```
rm -rf /mnt/etc
mv /mnt/restore/etc /mnt/etc
```

d. Repeat the previous step for each directory that successfully restored to /mnt/restore.

14.Restore individual files in the root (/) directory:

a. Change directory to /mnt/restore by typing cd /mnt/restore.

b. Restore the individual files in the root (/) directory by typing the following commands:

```
mv .//* /mnt
mv ./.* /mnt
```

d. Repeat the previous step for each directory that successfully restored to /mnt/restore.

15.Restore other mount points:

a. Check that file systems are mounted as expected by typing df -h at the command prompt.

b. Compare the output to the expected set of mounted file systems. If there are discrepancies, mount the devices onto the correct mount points.

c. Change directory to each mount point by typing a command similar to the following example:

```
    cd /mnt/home
```

d. Create a temporary restore directory, then change directory to it by typing commands similar to the following examples:

```
    mkdir ./restore
    cd ./restore
```

e. Restore the contents of the mount point by typing the following command:

```
    /mnt/usr/local/avamar/bin/avtar.bin -x --flagfile=/tmp/avtar.cmd
    --labelnumber=n /home
```

where \( n \) is the label number of the backup to use for the restore, and /home is an example mount point.
f. Return to the mount point directory, and delete all files except for the restore
directory by typing commands similar to the following examples:

```bash
alias ls=/usr/bin/ls
cd /mnt/home; rm -rf `ls --hide restore`
rm -rf ./.*
```

g. Change directory to the `restore` directory, then move the contents into the
correct place in the mount point by typing the following command:

```bash
cd ./restore; mv `ls -A ./` ..
```

h. Remove the `restore` directory by typing the following commands:

```bash
cd ..
rmdir restore
```

i. Repeat steps d through i for each remaining mount point.

16. Perform final system checks:

a. Inspect `/mnt/etc/fstab`, and verify that there are valid statements for each file
system to be mounted on the new system.

There are three ways that devices might be listed in the `fstab` file: device path,
volume label, and Universally Unique Identifier (UUID).

You can determine this information about the file systems by typing `/mnt/lib/
udev/vol_id device_path`, where `device_path` is the `/dev` path to the device.

If you created partitions manually during the minimal system install, the device
UUIDs might have changed. Update the device UUIDs in `/mnt/etc/fstab`. If
some volumes are missing expected labels, set the label by typing `/mnt/sbin/
e2label device_path label`.

b. Re-examine the `fstab` carefully.

The restored system cannot start correctly if the `fstab` entries do not exactly
match the storage device configuration, and the rescue system on the install
media has difficulty discovering which file systems to mount to `/mnt`.

---

**Note**

If you saved a reference copy of the `fstab` file when you were preparing the target
client for recovery, then you can find the disk information in that file. For systems
with few manual changes to the restored `fstab` file, it might be possible to use
the reference `fstab` file instead of the restored copy of the file.

---

c. Verify that no more files are present in `/mnt/sysimage/restore` by typing the
following command:

`ls -al /mnt/restore`

d. If the directory is empty, remove it by typing the following command:

`rmdir /mnt/restore`
17. Restart the system by typing `reboot`.
18. Eject the install media and start normally.
19. Confirm correct client operation.

Troubleshooting system recovery of a SUSE Linux client

The following topics provide details on troubleshooting issues that may occur after you perform system recovery of a SUSE Linux client.

Troubleshooting a boot failure after system recovery

If the restored system does not boot at the end of the restore procedure, then the version of GRUB installed by the minimal OS might be too dissimilar to the version previously used on the machine. You must boot into the restore environment and reinstall GRUB.

Procedure

1. Boot into the restore environment:
   a. Start the recovery target client from the install media (first CD/DVD) and select Rescue System.
   b. Open a command shell on the recovery target client and log in as root.
   c. Mount the root partition created in the minimal install to `/mnt` by typing the following command:
      ```
      mount /dev/sda# /mnt
      ```
      where `/dev/sda#` is the device that contains the root file system. If the drive was configured to use Linux Logical Volume Management, then the root device might be in the form of `/dev/VolGroup##/LogVol##`.

   d. Rebind the pseudo-file systems into the `/mnt` tree by typing the following commands:
      ```
      mount --rbind /proc /mnt/proc
      mount --rbind /sys /mnt/sys
      mount --rbind /dev /mnt/dev
      ```

   e. Change the current file system root by typing the following command:
      ```
      chroot /mnt
      ```

   f. Start the network as configured in the prerequisites by typing the following command:
      ```
      rcnetwork start
      ```

   g. Mount the auto-mount file systems and verify that the correct file systems were mounted by typing the following command:
      ```
      mount -a; df -h
      ```

   h. If any file systems are missing (for example, if `/boot` is not set to auto-mount), then manually mount them to the correct locations by using additional `mount` commands.
2. Reinstall GRUB by typing the following commands:

   ```
   chroot /mnt
   grub-install device
   ```

   where `device` is the boot device (for example, `/dev/sda`).

3. Exit the chroot environment by typing `exit`.

4. Reboot the system by typing `reboot`.

5. Eject the install media and start normally.

Restoring network settings after system recovery of a Linux client

If the operating system detects that you have restored the system to new hardware, it might revert the network settings to defaults (for example, DHCP name resolution instead of static IP). You can recover the previous network settings by manually reconfiguring the settings.

To examine the previous settings, open the `.bak` files in `/etc/sysconfig/network-scripts` in a text editor. These files contain useful information, but should not be used in the current configuration in an unmodified form, since they include MAC address information from the previous hardware.

**Oracle Solaris system recovery**

The following topics describe how to restore an Oracle Solaris client system to its original system state.

**Preparing for Oracle Solaris system recovery**

Ensure that the environment meets the following prerequisites before you perform system recovery for an Oracle Solaris system.

**Available backup with critical system files**

To successfully restore an Oracle Solaris client system to its original system state, you must have an Avamar backup of the entire local file system and the following critical system files and virtual file systems. This is accomplished by forcing traversal of the targets listed in the following table during a backup.

<table>
<thead>
<tr>
<th>Target</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mntfs</td>
<td><code>/etc/svc/volatile</code></td>
</tr>
<tr>
<td>tmpfs</td>
<td><code>/etc/mnttab</code></td>
</tr>
<tr>
<td>cachefs</td>
<td>Solaris Cache File System</td>
</tr>
<tr>
<td>fdfs</td>
<td>Solaris File Descriptor File System</td>
</tr>
<tr>
<td>fifofs</td>
<td>Solaris FIFO File System</td>
</tr>
<tr>
<td>namefs</td>
<td>Solaris Name File System</td>
</tr>
<tr>
<td>specfs</td>
<td>Solaris Device Special File System</td>
</tr>
<tr>
<td>swapfs</td>
<td>Solaris Swap File System</td>
</tr>
</tbody>
</table>
Table 36 Target locations for system recovery backups of an Oracle Solaris client (continued)

<table>
<thead>
<tr>
<th>Target</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tfs</td>
<td>Solaris Translucent File System</td>
</tr>
</tbody>
</table>

Use one of the following backup methods to ensure that these targets are included in a backup:

- In Avamar Administrator, explicitly add these targets in an on-demand backup or dataset by specifying `mntfs,tmpfs,cachefs,fdfs,fifofs,namefs,specfs,swapfs,tfs` in the Force traversal of the specified file system type(s) box in the plug-in options.

- Specify `--forcefs="mntfs,tmpfs,cachefs,fdfs,fifofs,namefs,specfs,swapfs,tfs"` on the avtar command line.

Available /var and /opt file systems

The original file system tables must have partitions for /opt and /var. The partitions for /opt and /var are mounted when you boot Solaris in read-only mode. If the partitions do not mount, then you must create new, temporary file systems for /opt and /var when you install a minimal version of Solaris on the client.

Other file systems

If you are using zfs or any other add-on file system, ensure that these file systems are properly re-created and mounted before beginning system recovery.

Installation of a minimal version of Solaris

Create a file system layout that matches the original system as closely as possible. Ensure that there are separate file systems for /opt and /var.

Performing system recovery of an Oracle Solaris client

Before you begin

Perform the steps in Preparing for Oracle Solaris system recovery on page 142.

Procedure

1. Start from CD by typing `reboot -- cdrom` or by changing the boot order in the BIOS menu, depending on the platform.

2. (Solaris 11 and 10 only) At the boot options menu, select one of the following options:
   - 3. Solaris Interactive Text (Desktop session)
   - 4. Solaris Interactive Text (Console session)

3. Continue through the prompts, providing the client hostname, IP address, default gateway, and corporate DNS server name when prompted to do so.

4. Exit the command prompt and return to a shell prompt:
   - On Solaris 8, press ! when you are prompted to install software for Solaris with Solaris Web Start.
   - On Solaris 10 or 11, press F5 to exit when you are prompted to select an installation type, and then press F2 to confirm the exit.

5. Mount the / partition under /a as the target of the restore by typing the following command:
mount /dev/dsk/c1t0d0s0 /a
Use the correct site-specific disk partition and mount parameters for the root volume.

6. Mount the /opt partition under /opt by typing the following command:
   ```
   mount /dev/dsk/c1t0d0s5 /opt
   ```
   Use the correct site-specific disk partition and mount parameters for the /opt volume.

7. Mount the /var partition under /var by typing the following command:
   ```
   mount /dev/dsk/c1t0d0s4 /var
   ```
   Use the correct site-specific disk partition and mount parameters for the /var volume.

8. Mount any additional file systems in their respective mount points under /a.
   If the mount point does not exist, create it. For example, to mount file system /data01 on c1t0d0s7, type the following command:
   ```
   mount /dev/dsk/c1t0d0s7 on /a/data01
   ```

9. Install the proper version of the Avamar Client for Solaris software by using the instructions in the *EMC Avamar Backup Clients User Guide*.

   **NOTICE**
   The installation program displays a warning about root (/) having 0 free bytes, as well as errors related to read-only file systems when trying to create /etc/init.d/avagent and various links in /usr/bin and /etc/rc.d/rcX.d. However, despite these warnings, all the binaries are correctly installed in /opt/AVMRclnt/bin.

10. Restore /etc to /a/etc by typing the following commands:
    ```
    cd /a/etc
    /opt/AVMRclnt/bin/avtar -x --server=Avamar_server --id=username --password=password --account=/domain/client --target=. /etc --
    labelnumber=n --overwrite=always
    ```
    where:
    - *Avamar_server* is the hostname or IP address of the Avamar server.
    - *username* and *password* are the Avamar login credentials for a user with a role that allows access to the backups for this client.
    - */domain/client* is the Avamar domain and Solaris client to restore.
    - *n* is the label number of the backup to restore. If you do not specify a label number, then the most recent backup is used for the restore.

   **NOTICE**
   You cannot restore the root file system directly to /a, because there is no way to restrict the restore operation to only the local partition without traversing network mount points. A restore directly to /a might copy files from all partitions, causing /a to fill up before all required files are restored.
11. Inspect /a/etc/vfstab to verify the original mount points for the local file system.
12. In Avamar Administrator, click the Backup & Restore launcher button.
   The Backup, Restore and Manage window appears.
13. Click the Restore tab.
14. In the clients tree, select the original Solaris client.
15. Find and select the backup to use for the restore.
16. Examine the directories and files that originally existed under root (/).
17. For each directory that originally existed under root (/), perform the following steps:
   a. If the directory does not exist, then manually create an empty directory with the same name under /a.
   b. Change directory to that directory.
   c. From the command line, restore the contents of the directory from the backup.

   For example, consider the following commands to restore /usr:

```
mkdir /a/usr
cd /a/usr
/opt/AVMRclnt/bin/avtar -x --server=Avamar_server --id=username --password=password --account=/domain/client --labelnumber=n --overwrite=always --target=. /usr
```

   If /opt and /var were originally on the root partition, then you can restore to /a/opt and /a/var. If /opt and /var were separate file systems, then restore to new, temporary locations, such as /a/newopt and /a/newvar. After completing all restores, move the contents of /a/newopt to /opt and /a/newvar to /var.
18. To restore the individual files that originally existed under root, run the restore command with the --norecursion option to restore files without descending into subdirectories:

```
/opt/AVMRclnt/bin/avtar -x --server=Avamar_server --id=username --password=password --account=/domain/client --labelnumber=n --norecursion --overwrite=always --target=. /
```
19. Restart the client normally and confirm correct operation.
This chapter includes the following topics:

- Server shutdown and restart ................................................................. 148
- Suspending and resuming server activities ........................................... 150
- Managing client sessions ..................................................................... 151
- Managing client agents and plug-ins .................................................... 154
- Backup and maintenance windows ....................................................... 156
- Checkpoints ......................................................................................... 158
- Generating and installing a server license ............................................. 161
- Managing services ................................................................................ 164
- Changing server passwords and OpenSSH keys ................................... 165
- MCS configuration settings ................................................................. 167
- Using network address translation (NAT) ............................................. 170
- Editing network settings for a single-node server ................................. 171
- Adding a custom security notification for web browser logins ............... 171
- Viewing and editing server contact information ................................... 172
Server shutdown and restart

The `dpnctl` program enables you to gracefully shut down and restart the entire Avamar server or selected subsystems.

Shutting down the server

Before you begin

Ensure that there is a recent and validated checkpoint before you perform a full system shutdown.

Procedure

1. Open a command shell and log in by using one of the following methods:
   - For a single-node server, log in to the server as admin.
   - For a multi-node server:
     a. Log in to the utility node as admin.
     b. Load the admin OpenSSH key by typing:

        ```
        ssh-agent bash
        ssh-add ~admin/.ssh/admin_key
        ```
     c. When prompted, type the `admin_key` passphrase and press Enter.

2. Type `dpnctl stop`.

   A confirmation message prompts whether to shut down the local instance of EM Tomcat.

3. Type `y` to shut down the local EM Tomcat instance, and then press Enter.

   The output displays the status of the shutdown process until the shut down is complete.

Restarting the server

Procedure

1. Open a command shell and log in by using one of the following methods:
   - For a single-node server, log in to the server as admin.
   - For a multi-node server:
     a. Log in to the utility node as admin.
     b. Load the admin OpenSSH key by typing:

        ```
        ssh-agent bash
        ssh-add ~admin/.ssh/admin_key
        ```
     c. When prompted, type the `admin_key` passphrase and press Enter.

2. Type `dpnctl start`.

   The output displays a confirmation message.

3. Type `y` to proceed with restarting the server, and then press Enter.

   The output displays the status of the restart process until the restart is complete.
Stopping the MCS

Procedure
1. Open a command shell and log in by using one of the following methods:
   - For a single-node server, log in to the server as admin.
   - For a multi-node server:
     a. Log in to the utility node as admin.
     b. Load the admin OpenSSH key by typing:
        
        ```bash
        ssh-agent bash
        ssh-add ~admin/.ssh/admin_key
        ```
     c. When prompted, type the `admin_key` passphrase and press Enter.
2. Type `dpnctl stop mcs`.

Starting the MCS

Procedure
1. Open a command shell and log in by using one of the following methods:
   - For a single-node server, log in to the server as admin.
   - For a multi-node server:
     a. Log in to the utility node as admin.
     b. Load the admin OpenSSH key by typing:
        
        ```bash
        ssh-agent bash
        ssh-add ~admin/.ssh/admin_key
        ```
     c. When prompted, type the `admin_key` passphrase and press Enter.
2. Type `dpnctl start mcs`.
3. Resume scheduled operations by typing `dpnctl start sched`.

Getting MCS status

Procedure
1. Open a command shell and log in by using one of the following methods:
   - For a single-node server, log in to the server as admin.
   - For a multi-node server:
     a. Log in to the utility node as admin.
     b. Load the admin OpenSSH key by typing:
        
        ```bash
        ssh-agent bash
        ssh-add ~admin/.ssh/admin_key
        ```
     c. When prompted, type the `admin_key` passphrase and press Enter.
2. Type `dpnctl status mcs`.
Stopping the EM Tomcat server

Procedure
1. Open a command shell and log in by using one of the following methods:
   - For a single-node server, log in to the server as admin.
   - For a multi-node server, log in to the utility node as admin.
2. Type `dpnctl stop emt`.

Starting the EM Tomcat server

Before you begin
Ensure that EM Tomcat server has been correctly shut down.

Procedure
1. Open a command shell and log in by using one of the following methods:
   - For a single-node server, log in to the server as admin.
   - For a multi-node server, log in to the utility node as admin.
2. Type `dpnctl start emt`.

Getting EM Tomcat server status

Procedure
1. Open a command shell and log in by using one of the following methods:
   - For a single-node server, log in to the server as admin.
   - For a multi-node server:
     a. Log in to the utility node as admin.
     b. Load the admin OpenSSH key by typing:

        `ssh-agent bash`
        `ssh-add ~admin/.ssh/admin_key`
        c. When prompted, type the `admin_key` passphrase and press Enter.
2. Type `dpnctl status emt`.

Suspending and resuming server activities

You can suspend and resume backups and restores, scheduled operations, and maintenance activities.

Suspending and resuming backups and restores

Procedure
1. In Avamar Administrator, click the Server launcher button.
   The Server window appears.
2. Click the Server Management tab.
3. In the left pane, select the Avamar server node.
4. Open the Actions menu and select Suspend Backups/Restores or Resume Backups/Restores.
   A confirmation message appears.
5. Click Yes.

Suspending and resuming scheduled operations

Procedure
1. In Avamar Administrator, select Tools > Manage Schedules.
   The Manage All Schedules window appears.
2. Click Suspend All or Resume All.

Suspending and resuming maintenance activities

Procedure
1. In Avamar Administrator, click the Server launcher button.
   The Server window appears.
2. Open the Actions menu and select Suspend Maintenance Activities or Resume Maintenance Activities.
   A confirmation message appears.
3. Click OK.

Managing client sessions

You can view a detailed log of a client session to perform troubleshooting or analysis of a backup or restore. If necessary, you can cancel a client session or reset a client when unexpected system behavior occurs.

Monitoring client sessions

The Session Monitor displays a list of active client backup and restore sessions.

Procedure
1. In Avamar Administrator, click the Server launcher button.
   The Server window appears.
2. Click the Session Monitor tab.
   The information in the following table appears for each session in the Session Monitor.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>User</td>
<td>Avamar user ID (account name).</td>
</tr>
<tr>
<td>Path</td>
<td>Specifies a hierarchical location in the Avamar server. This option is relative to the user's home location unless slash (/) is prefixed to the path designation, in which case an absolute path is assumed.</td>
</tr>
</tbody>
</table>
Table 37 Session Monitor tab properties (continued)

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Domain</td>
<td>Avamar domain where this user resides.</td>
</tr>
<tr>
<td>Client ID</td>
<td>Unique identifier for this Avamar client.</td>
</tr>
<tr>
<td>Session</td>
<td></td>
</tr>
<tr>
<td>Type</td>
<td>This activity is either avtarbackup or avtarrestore.</td>
</tr>
<tr>
<td>Root</td>
<td>Top level of the file system being backed up, restored, or validated.</td>
</tr>
<tr>
<td>Start time</td>
<td>Date and time that this client session started.</td>
</tr>
<tr>
<td>Plug-in</td>
<td>Plug-in used for this activity.</td>
</tr>
<tr>
<td>Session ID</td>
<td>Unique identifier for this client session.</td>
</tr>
<tr>
<td>Work order ID</td>
<td>Unique identifier for this activity.</td>
</tr>
<tr>
<td>Elapsed</td>
<td>Length of time that this client session has been running.</td>
</tr>
<tr>
<td>Progress bytes</td>
<td>Total number of bytes examined during this activity.</td>
</tr>
<tr>
<td>New bytes</td>
<td>Percentage of new bytes backed up to either the Avamar server or a Data Domain system. Low numbers indicate high levels of data deduplication.</td>
</tr>
<tr>
<td>System</td>
<td></td>
</tr>
<tr>
<td>Name</td>
<td>Client hostname.</td>
</tr>
<tr>
<td>OS name</td>
<td>Operating system used by this client.</td>
</tr>
<tr>
<td>App version</td>
<td>Avamar client software version.</td>
</tr>
</tbody>
</table>

Viewing a detailed client session log

You can view a detailed log of a client session to perform troubleshooting or analysis.

Procedure

1. In Avamar Administrator, click the Activity launcher button. The Activity window appears.
2. Click the Activity Monitor tab. By default, the Activity Monitor shows a detailed log of all client backup activity for the past 72 hours.
3. Specify the session log options:
   a. Select Action > Session Log Options. The Session Log Options dialog box appears.
   b. Select Show HTML logs to view the session log summary in HTML format, or Show raw logs to view the session log summary as unformatted text.
   c. (Optional) If you select the HTML log format, select the Show debug information checkbox to include debug information in the session log summary.
   d. Click OK.
4. Select an activity in the list.

5. Select **Actions** > **View Session Log**.

   The *Activity Session Drill-down* dialog box appears.

6. Perform any of the following tasks in the session log summary:
   - (HTML format only) In the **Log Files** section, click a hyperlink to go to the log file.
   - Search for a specific text string in the session log summary by typing a text string in the **Find** field and then clicking **Next** or **Previous**.
   - Return to the top of the session log summary by clicking **Back to Top**.
   - Export the session log summary to a file by clicking **Export**, specifying a location for the file, and clicking **Save**.
   - Update the contents in the session log summary by clicking **Refresh**.

7. Click **Close**.

---

### Creating a Zip file for EMC Customer Support

The *Activity* window enables you to create a Zip file of session log information for EMC Customer Support and upload the Zip file to the Avamar server.

**Procedure**

1. In Avamar Administrator, click the *Activity* launcher button.
   
   The *Activity* window appears.

2. Select an activity in the list.

3. Select **Actions** > **Download Support Bundle**.
   
   The *Download Support Bundle* dialog box appears.

4. Navigate to a directory for the zip file.

5. Click **Save**.
   
   A progress dialog box displays the status of the operation.

6. When the operation completes, click **Close** on the progress dialog box.

7. To create a Zip file and copy it to the Avamar server, select **Actions** > **Upload Support Bundle to Server**.

   The upload process creates a Zip file for session log summary information and copies the Zip file to the /tmp folder on the Avamar server. A progress dialog box displays the status of the operation.

---

### Canceling a client session

Occasionally, a client might experience unexpected system behavior while it is performing a backup or restore. In these cases, it might be necessary to force an end to these client sessions from Avamar Administrator.

**Procedure**

1. In Avamar Administrator, click the *Server* launcher button.
   
   The *Server* window appears.

2. Click the *Session Monitor* tab.

   A list of active client sessions appears.
3. Select the client session to cancel.

4. Select Actions > Cancel Session.
   A dialog box shows the progress of the cancellation.

5. When the cancellation is complete, click Close.

After you finish
If you cannot cancel the client session, reset the client. This immediately and forcibly terminates active aVtaR sessions on the client.

Resetting a client
Resetting a client immediately and forcibly terminates active client aVtaR session on that client. In most cases, you should try to cancel the client session before resetting it.

Procedure
1. In Avamar Administrator, click the Policy launcher button.
   The Policy window appears.
2. Click the Policy Management tab.
3. Click the Clients tab.
4. Select the client to reset.
5. From the Actions menu, select Client > Reset Client.

Managing client agents and plug-ins
Each time a client communicates with an Avamar server, it identifies itself by sending the client ID, the specific agent version and build running on that client, and a list of plug-ins (version and build) currently installed on that client. Occasionally, because of known incompatibilities, you may want to deny Avamar server access to all clients running a specific version (all builds) or a specific build of a client agent or plug-in.

You can also selectively allow or disallow the following plug-in operations for all clients running a specific plug-in version (all builds) or build:

- Client activations initiated from the client
- On-demand backups initiated from the client
- Scheduled backups
- Restores
- Backup validation
- Ability to browse stored backups on the server

Any specific version (all builds) or build that is designated as obsolete is denied access to the Avamar server. A build is designated as obsolete only in cases of known incompatibility between the client agent or plug-in and the specific version of server software that was installed. Therefore, to prevent potential problems, this obsolete designation cannot be overridden using the feature to edit properties for that version or build.
Adding a build record

You can add an MCS database record for a specific client agent or plug-in build. You can only add records at the build level. New version records are automatically added after Avamar server software upgrades.

Procedure
1. In Avamar Administrator, select Tools > Manage Agents & Plug-ins.
   The Manage All Agents & Plug-ins window appears.
2. In the left pane, select the agent or plug-in version for the build.
3. Click New.
   The New Build dialog box appears.
4. In the Build box, type a valid agent or plug-in build number.
5. To deny Avamar server access to clients with this agent or plug-in build, select the Disable checkbox.
6. (Optional) Type a descriptive comment in the Comment box.
7. Click OK.

Editing version or build records

Procedure
1. In Avamar Administrator, select Tools > Manage Agents & Plug-ins.
   The Manage All Agents & Plug-ins window appears.
2. In the left pane, select the agent or plug-in.
3. In the right pane, select the version or build to edit.
4. Click Edit.
   The Edit Build dialog box appears.
5. To deny Avamar server access to clients with this agent or plug-in build, select the Disable checkbox.
6. (Optional) Type a descriptive comment in the Comment box.
7. Click OK.

Deleting a build record

You can delete an MCS database record for a specific client agent or plug-in build. You cannot delete a record for an entire version.

Procedure
1. In Avamar Administrator, select Tools > Manage Agents & Plug-ins.
   The Manage All Agents & Plug-ins window appears.
2. In the left pane, select the agent or plug-in.
3. In the right pane, select the build to delete.
4. Click Delete.
Disabling all client initiated activations

You may want to temporarily prevent clients from activating with the Avamar server to place the system in a state that supports maintenance activities. Client Invite will not work when clients are prevented from activating.

Procedure

1. In Avamar Administrator, select Tools > Manage Agents & Plug-ins.
   The Manage All Agents & Plug-ins window appears.
2. Click Disable All Client Initiated Activations.
3. To re-enable client initiated activations, click Enable All Client Initiated Activations.

Disabling all client initiated backups

You can temporarily prevent Avamar clients from initiating on-demand backups to place the system in a state that supports various maintenance activities.

Procedure

1. In Avamar Administrator, select Tools > Manage Agents & Plug-ins.
   The Manage All Agents & Plug-ins window appears.
2. Click Disable All Client Initiated Backups.
3. To re-enable client initiated on-demand backups, click Enable All Client Initiated Backups.

Backup and maintenance windows

Each 24-hour day is divided into two operational windows, the backup window and the maintenance window.

The following figure shows the default backup and maintenance windows.
Backup window
The backup window is that portion of each day that is reserved to perform normal scheduled backups. No maintenance activities are performed during the backup window. The default backup window begins at 8 p.m. local server time and continues uninterruptedly for 12 hours until 8 a.m. the following morning. You can customize the backup window start time and duration.

Maintenance window
The maintenance window is that portion of each day that is reserved to perform the routine server maintenance activities in the following table.

Table 38 Avamar server maintenance activities

<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Checkpoint</td>
<td>A snapshot of the Avamar server that is taken for the express purpose of server rollbacks.</td>
</tr>
<tr>
<td>Checkpoint validation</td>
<td>An internal operation that validates the integrity of a specific checkpoint. Checkpoint validation is also known as a Hash File System (HFS) check. After a checkpoint passes an HFS check, it can be considered reliable enough to be used for a server roll back.</td>
</tr>
<tr>
<td>Garbage collection</td>
<td>An internal operation that recovers storage space from deleted or expired backups.</td>
</tr>
</tbody>
</table>

Although you can perform backups and restores during the maintenance window, doing so impacts the backup, restore, and maintenance activities. For this reason, minimize
any backup, restore, or administrative activities during the maintenance window. There might be brief periods of time when backup or administrative activities are not allowed.

The default maintenance window begins at 8 a.m. local server time and continues uninterrupted for 12 hours until 8 p.m. Although you cannot directly customize the maintenance window, its start time and duration are derived from backup window settings.

**Editing the backup and maintenance windows**

You can edit the backup and maintenance windows by setting the backup window start time and duration, as well as the time zone for the backup and maintenance windows.

Any changes to the backup window duration also affect the maintenance window duration. For example, changing the backup window duration from 12 hours to 14 hours reduces the maintenance window duration by 2 hours.

The following best practices apply when you schedule system activities:

- **Limit on-demand backups during the maintenance window**
  You might want to advise users to avoid initiating any on-demand backups from their client computers during the first hour and thirty minutes of the maintenance window (8 a.m. to 8 p.m. local time for most systems).

- **Avoid initiating on-demand maintenance activities**
  Manually initiating maintenance activities such as checkpoints, checkpoint validation, or garbage collection temporarily disables all scheduled maintenance activities until the manually initiated operation completes. Unless there is a pressing need to initiate an on-demand maintenance activity, it is best to rely on scheduled maintenance activities to ensure that sufficient time is allocated for each activity daily.

**Procedure**

1. In Avamar Administrator, select **Tools > Manage Schedules**.
   The **Manage All Schedules** window appears.
2. Click the **Maintenance Window** tab.
3. Change the backup window start time, duration, or time zone by selecting a new value from the corresponding list.
4. Click **OK**.

**Checkpoints**

Checkpoints are system-wide backups that are taken for the purpose of assisting with disaster recovery.

A checkpoint occurs automatically during the maintenance window. You can also manually start checkpoints at any time.

You can delete checkpoints to reclaim server storage capacity.

The **Checkpoint Management** tab on the **Server** window in Avamar Administrator displays the status of individual checkpoints. The following table provides the possible states for a checkpoint.
Table 39 Checkpoint states

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>⚩</td>
<td>The checkpoint failed validation or was canceled before it could complete.</td>
</tr>
<tr>
<td>⚫</td>
<td>The checkpoint has not yet been validated.</td>
</tr>
<tr>
<td>✓</td>
<td>Validation is being performed on this checkpoint.</td>
</tr>
<tr>
<td>✓</td>
<td>The checkpoint passed validation.</td>
</tr>
</tbody>
</table>

Creating a checkpoint

A checkpoint occurs automatically during the maintenance window. You can also manually initiate checkpoints at any time.

Procedure
1. In Avamar Administrator, click the Server launcher button.
   The Server window appears.
2. Click the Checkpoint Management tab.
3. Select Actions > Create Checkpoint.
   A progress dialog box displays the status of the operation.
4. When the checkpoint completes, click Close.

Deleting a checkpoint

You can delete checkpoints to reclaim additional server storage capacity. Generally, it is best to delete unvalidated checkpoints before you delete validated checkpoints.

Procedure
1. In Avamar Administrator, click the Server launcher button.
   The Server window appears.
2. Click the Checkpoint Management tab.
3. Select the checkpoint and select Actions > Delete Checkpoint.
   A confirmation message appears.
4. Click OK.

Rolling back to a checkpoint

Rollback is the process of restoring the Avamar server to a known good state using data stored in a validated checkpoint. You cannot roll back an Avamar 7.2 server to a version 4.x or earlier checkpoint.

Before you begin
If you added nodes to the Avamar server after the checkpoint occurred, remove the entries for the nodes from the probe.out file.

EMC recommends using a validated checkpoint for roll back. Checkpoint validation occurs during each maintenance window.
Note
If you need a validated checkpoint before the next maintenance window completes, contact EMC Customer Support for assistance.

Procedure
1. Open a command shell and log in by using one of the following methods:
   - For a single-node server, log in to the server as admin.
   - For a multi-node server:
     a. Log in to the utility node as admin.
     b. Load the admin OpenSSH key by typing:
        
        ```
        ssh-agent bash
        ssh-add ~/.ssh/admin_key
        ```
     c. When prompted, type the `admin_key` passphrase and press Enter.
2. Shut down the server by typing `dpnctl stop`.
3. Display a list of checkpoints by typing `cplist`.
   The checkpoint list appears similar to the following example:
   ```
   cp.20140106170113 Fri Jan  6 17:01:13 2014 valid hfs del
   nodes 4 stripes 396
   cp.20140107170042 Sat Jan  7 17:00:42 2014 valid hfs del
   nodes 4 stripes 396
   cp.20140108170040 Sun Jan  8 17:00:40 2014 valid hfs ...
   nodes 4 stripes 396
   cp.20140109170043 Mon Jan  9 17:00:43 2014 valid hfs ...
   nodes 4 stripes 396
   ```
   where:
   - `cp.yyyyMMddhhmmss` is the checkpoint ID.
   - `valid hfs` indicates a validated checkpoint.
   - `valid par` indicates a partially validated checkpoint.
4. Note the checkpoint ID of the checkpoint that you plan to use for the checkpoint.
   Generally, roll the system back to the most recent fully validated checkpoint unless you have a good reason to roll back to an earlier checkpoint.
5. Start the roll back by typing the following command:
   ```
   rollback.dpn --cptag=checkpoint_id >& file
   ```
   where `checkpoint_id` is the checkpoint ID and `file` is a temporary file.
6. Wait for the roll back to complete. The roll back might take an hour, depending on the amount of data present in the Avamar server.
   When the roll back is complete, the command prompt returns.
7. Open the user-defined temporary file that was created during the roll back, and verify that the roll back successfully completed without errors.
   The server automatically restarts after a successful roll back.
Clearing a data integrity alert

To ensure data integrity, the Avamar server issues an alert any time a checkpoint validation fails. The only way to clear this alert is to contact EMC Customer Support to obtain a reset code, and then input that code in the Clear Data Integrity Alert dialog box.

Before you begin
Obtain a reset code from EMC Customer Support.

Procedure
1. In Avamar Administrator, click the Administration launcher button. The Administration window appears.
2. Click the Event Management tab.
3. Click the Unacknowledged Events tab near the bottom of the window.
5. Type the reset code in the Enter reset code field and click OK.

Generating and installing a server license

The Avamar server requires a license key for permanent operation. Otherwise, the Avamar server stops performing several functions after a 30-day grace period. To avoid interruptions to the Avamar server functioning, generate and install a permanent license.

Procedure
1. Obtain the assigned license key for the Avamar server software.
2. Use the gathergsankeydata utility to generate a gsankeydata.xml license key information file.
   If you already generated the gsankeydata.xml file during the Avamar server software installation and configuration, then skip this step.
3. Generate a permanent license key file.
4. Install and activate the license on the Avamar server.

Obtaining assigned license keys

The assigned license key for the Avamar server software includes the customer account identification number and the Avamar system asset identification number. These values are required to generate a permanent license.

The following example is an assigned license key:

EMC Avamar Software License Key Information
Avamar System Customer Account ID: CN-10062734404
Avamar System Asset ID: A-2010014578

Procedure
- Find the assigned license keys on EMC Online Support on the license management page.

To access EMC Online Support, type the login credentials provided in the EMC License Authorization (LAC) email sent to you from licensingnorthamerica@emc.com,
licensingemea@emc.com, or licensingapj@emc.com. If you cannot find the email, send an email to licensing@emc.com to request that the EMC License Authorization email be resent. Include the EMC product SO number in the email. The EMC product SO number is required.

To access the license management page on EMC Online Support, click the Get and Manage Licenses link below the Service Center section of the home page.

Generating a license key information file

Procedure

1. Open a command shell and log in by using one of the following methods:
   - For a single-node server, log in to the server as admin.
   - For a multi-node server:
     a. Log in to the utility node as admin.
     b. Load the admin OpenSSH key by typing:

```
ssh-agent bash
ssh-add ~admin/.ssh/admin_key
```
   c. When prompted, type the admin_key passphrase and press Enter.

2. Type `gathergsankeydata`.

   The output prompts you to specify the customer account number.

3. Type the Avamar system customer account number and press Enter.

   A valid Avamar system customer account number (account ID) conforms to the format CN-yymmddnnnnn, where yymmdd is a year, month, and day, and nnnnn is a five-digit numeric sequence.

   The output prompts you to specify the Avamar system asset ID number.

4. Type the Avamar system asset ID number and press Enter.

   A valid Avamar system asset ID number (asset reference ID) conforms to the format A-yyyyynnnnnn, where yyyy is a year and nnnnnn is a six-digit numeric sequence.

   The output prompts you to specify the Internet domain for the account.

5. Type the Internet domain and press Enter.

6. Type y and press Enter.

   The local directory contains the gsankeydata.xml license key information file. This file is used to generate the permanent license key.

Generating a permanent license key file

Procedure

1. Access EMC Online Support (https://support.EMC.com) and type the login credentials from the EMC License Authorization (LAC) email that licensingnorthamerica@emc.com, licensingemea@emc.com, or licensingapj@emc.com sent to you.

   The Welcome to the EMC Online Support Site page appears.
1. Log in to the email account to which the license key file was sent.
2. Open the email message from info@Avamar.com with a subject line of EMC Avamar Key Information.
   The email message contains the license key file as an attached XML file named asset_Key.xml, where asset is the DNS name of the Avamar server.
3. Save the attachment to a temporary directory.
4. Use WinSCP or an equivalent program to copy the asset_Key.xml file to the /tmp directory on a single-node server or to the /tmp directory on the utility node in a multi-node server.
5. Open a command shell and log in by using one of the following methods:
   - For a single-node server, log in to the server as admin.
   - For a multi-node server:
     a. Log in to the utility node as admin.
     b. Load the admin OpenSSH key by typing:
        ```bash
        ssh-agent bash
        ssh-add ~admin/.ssh/admin_key
        ```
     c. When prompted, type the admin_key passphrase and press Enter.
6. Ensure that the Avamar server subsystem (also known as GSAN) is running by typing dpnctl status gsan.
   If GSAN is running, the output displays a status of ready.
7. Use the correct command sequence to change file permissions on the asset_key.xml file and activate the license.

<table>
<thead>
<tr>
<th>Server status</th>
<th>Command sequence</th>
</tr>
</thead>
</table>
| Running       | chmod 644 /tmp/asset_key.xml  
|               | avmaint license /tmp/asset_key.xml --avamaronly  
|               | where asset_key.xml is the license key file. |
| Not running   | cd /usr/local/avamar/etc  
|               | mv license.xml license.xml.old  
|               | cp /tmp/asset_key.xml license.xml  
|               | chmod 644 license.xml  
|               | where asset_key.xml is the license key file. |

8. If the Avamar server is not running, start it by typing dpnctl start.

9. After the Avamar server restarts, verify that the server license is correctly installed by typing the following command:

   avmaint license --avamaronly

   License information appears in the command shell.

Managing services

The Services Administration tab on the Administration window in Avamar Administrator enables you to start, stop, suspend, or resume individual services on the Avamar server.

Procedure

1. In Avamar Administrator, click the Administration launcher button.

   The Administration window appears.

2. Click the Services Administration tab.

3. Manage the services:

   - To start a service, right-click the service and select Start.
   - To stop a service, right-click the service and select Stop.
   - To suspend a service temporarily, until you explicitly resume it, right-click the service and select Suspend.
   - To resume a service that you previously suspended, right-click the service and select Resume.

Information on the Services Administration tab

The following information appears on the Services Administration tab.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hostname</td>
<td>DNS name of the Avamar server.</td>
</tr>
<tr>
<td>IP Address</td>
<td>IP address of the Avamar server.</td>
</tr>
</tbody>
</table>
Table 40 Services Administration tab information (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Load Average</td>
<td>Average number of CPU threads over the past minute.</td>
</tr>
<tr>
<td>Last Administrator Datastore Flush</td>
<td>Date and time of the last MCS flush.</td>
</tr>
<tr>
<td>PostgreSQL database</td>
<td>Status of the MCS database.</td>
</tr>
<tr>
<td>Web Services</td>
<td>Status of MCS web services.</td>
</tr>
<tr>
<td>Web Restore Disk Space</td>
<td>Number of hard drive bytes that MCS web services can use to create the restore Zip file.</td>
</tr>
<tr>
<td>Available</td>
<td></td>
</tr>
<tr>
<td>Login Manager</td>
<td>Status of the Avamar Login Manager service.</td>
</tr>
<tr>
<td>snmp sub-agent</td>
<td>Status of the Avamar SNMP sub-agent service.</td>
</tr>
<tr>
<td>ConnectEMC</td>
<td>Status of the ConnectEMC service.</td>
</tr>
<tr>
<td>VMware vCenter Connection</td>
<td>Status of the VMware vCenter connections. This service is only listed when at least one vCenter client is added to the system.</td>
</tr>
<tr>
<td>Monitor</td>
<td></td>
</tr>
<tr>
<td>snmp daemon</td>
<td>Status of the Avamar SNMP master agent service.</td>
</tr>
<tr>
<td>ssh daemon</td>
<td>Status of the Avamar Secure Shell (SSH) service.</td>
</tr>
<tr>
<td>syslog daemon</td>
<td>Status of the Avamar syslog service.</td>
</tr>
<tr>
<td>Data Domain SNMP Manager</td>
<td>Status of the SNMP service for monitoring configured Data Domain systems.</td>
</tr>
<tr>
<td>Remote Backup Manager Service</td>
<td>Status of the external backup manager service that is used by the Replicas at Source feature.</td>
</tr>
<tr>
<td>RabbitMQ</td>
<td>Status of the RabbitMQ message broker service.</td>
</tr>
<tr>
<td>Replication cron job</td>
<td>Status of the replication cron job on the Avamar server.</td>
</tr>
</tbody>
</table>

**Note**

The list of services on the **Services Administration** tab varies according to the configuration of the Avamar system.

### Changing server passwords and OpenSSH keys

Use the `change-passwords` utility to change the passwords for operating system user accounts and Avamar server user accounts. Also use `change-passwords` to create and modify SSH keys for those accounts.

The `change-passwords` utility guides you through the following operations:

- Changing passwords for the operating system accounts: admin, dpn, and root
- Changing passwords for the internal Avamar server accounts: root, MCUser, repluser, and viewuser
- Creating and changing SSH keys
Procedure

1. Suspend all scheduled operations:
   a. In Avamar Administrator, select Tools > Manage Schedules.
   b. On the Manage All Schedules window, click Suspend All.

2. Open a command shell and log in using one of the following methods:
   - To log in to a single-node server, log in to the server as dpn.
   - To log in to a multi-node server, log in to the utility node as dpn.

3. Start the utility by typing `change-passwords`.
   On a multi-node server, the output prompts you to specify whether to change passwords on all nodes or selected nodes.

4. Type `y` to change passwords on all nodes or `n` to change passwords on selected nodes, and then press Enter.
   The output prompts you to indicate whether you plan to specify SSH private keys that are authorized for root operations.

5. Type `n` and press Enter.
   The output prompts you to specify whether to change admin, dpn, or root operating system user account passwords.

6. Type `y` to change the passwords or `n` to skip the process of changing the passwords, and then press Enter.

7. If you typed `y` in the previous step, then follow the system prompts to change the passwords for one or more of the admin, dpn, or root operating system user accounts.
   The output prompts you to specify whether to change SSH keys.

8. Type `y` to change or create an SSH key, or type `n`, and then press Enter.

9. If you typed `y` in the previous step, then follow the system prompts to change or create the keys.
   The output prompts you to specify whether to change Avamar server passwords.

10. When prompted, type `y` to change the MCUser, Avamar root, repluser, and viewuser passwords, or if you do not want to change the passwords, type `n`, and then press Enter.

11. If you typed `y` in the previous step, then follow the system prompts to change the passwords.
    The output prompts you to accept or reject the changes that are made to passwords or SSH keys during this utility session.

12. Type `y` to accept the changes or type `n` to exit this utility session without changes, and then press Enter.
    The output provides the status of the operation.

13. When the operation completes, resume scheduled operations:
    a. In Avamar Administrator, select Tools > Manage Schedules.
    b. On the Manage All Schedules window, click Resume All.
MCS configuration settings

Avamar Administrator consists of both client and server software applications. You can independently configure each application by editing either the server or client preferences file.

Changes to the server preferences file, `mcserver.xml`, affect all Avamar Administrator sessions. Changes to a client preferences file, `mcclient.xml`, only affect Avamar Administrator sessions on that client. Both files conform to the `preferences.dtd` XML Document Type Description (DTD) referenced by the JSDK 1.4 API.

Default and live copies
Two copies of each of these files are present on the system:

- An initial default copy is used to initialize each application after installation.
- A live copy contains the current settings used by the application.

The default copies are located in the `/lib` directory for each application. The live copies are located in a “live file” directory. The following table lists the default live file directory for each application.

<table>
<thead>
<tr>
<th>Application</th>
<th>Default live file directory</th>
</tr>
</thead>
<tbody>
<tr>
<td>Server</td>
<td><code>/usr/local/avamar/var/mc/server_data/prefs</code></td>
</tr>
<tr>
<td>Client</td>
<td><code>install_directory/var/mc/gui_data/prefs</code>, where <code>install_directory</code> is typically <code>C:\Program Files\avs\administrator</code> on Microsoft Windows computers and <code>/usr/local/avamar</code> on Linux computers.</td>
</tr>
</tbody>
</table>

Initialization behavior
When either the server or client application is initialized, the respective default preferences file in the `/lib` directory is loaded into memory and replicated to the live file directory.

**Note**

Reinitializing a running MCS is highly destructive. It completely overwrites any custom preference settings stored in the live file and reverts the system configuration back to default settings. If this occurs, you must recover custom preference settings from a previous flush (backup) if they are overwritten.

Upgrade behavior
During server upgrades, any `mcserver.xml` entry that is marked with the `merge="delete"` attribute in the new default `mcserver.xml` file is not merged into the new live copy. These entries are obsolete. They are retained in the default `mcserver.xml` file so that the MCS knows to delete the preferences on an upgraded customer system.

You can manually add a `merge="keep"` attribute to any entry in the live `/usr/local/avamar/var/mc/server_data/prefs/mcserver.xml` file. Settings with `merge="keep"` attributes are retained in the new live copy after the upgrade.
Backing up MCS data

To protect itself from hardware failures, the MCS automatically backs up or flushes its persistent data to the Avamar server hourly and as part of system checkpoints. Flushes are done by way of an avtar client session. You can also force an on-demand flush.

The flush process generates the timestamp files in the following table.

**Table 42 MCS backup timestamp files**

<table>
<thead>
<tr>
<th>File</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>flush.timestamp</td>
<td>Before every flush, flush.timestamp is created in the server_data directory. This file includes the time and date of the flush. On a server rollback, this file is restored and can be used to verify that the rollback was successful to the selected time and date. The contents of flush.timestamp are also accessible by using of the mcserver.sh --status command.</td>
</tr>
<tr>
<td>init.timestamp</td>
<td>During system initialization, the init.timestamp file is created or overwritten in the server_data directory. This file includes the time and date of the system initialization and can be used to verify that initialization was successful on the selected time and date.</td>
</tr>
</tbody>
</table>

**Procedure**

1. Open a command shell and log in by using one of the following methods:
   - For a single-node server, log in to the server as admin.
   - For a multi-node server:
     a. Log in to the utility node as admin.
     b. Load the admin OpenSSH key by typing:
        ```
        ssh-agent bash
        ssh-add ~admin/.ssh/admin_key
        ```
     c. When prompted, type the admin_key passphrase and press Enter.
2. Type the following command to initiate an on-demand MCS flush:
   ```
   mcserver.sh --flush
   ```

Restoring MCS data

**Before you begin**

If you are planning to restore MCS data to a specific backup instead of the most recent backup, then find the label number for the backup either by browsing for the backup in Avamar Administrator or by using the avtar command:

- In Avamar Administrator, open the Backup, Restore and Manage window, and browse for backups in the /MC_BACKUPS account.
- Type the following command on a single command line:
  ```
  avtar --backups --id=root --ap=password --path=/MC_BACKUPS --hfsaddr=Avamar_server --count=n
  ```
  where password is the Avamar root user account password (not the operating system root password), Avamar_server is the IP address or DNS name of the Avamar server,
and \( n \) is the number of backups to list. A total number of 26 MCS flushes typically occurs each day for an Avamar server—one per hour and one each during the morning and evening system checkpoints. Therefore, to list all MCS backups for a specific past number of days, specify \(--count=n\) in increments of 26.

**Procedure**

1. Open a command shell and log in by using one of the following methods:
   - For a single-node server, log in to the server as admin.
   - For a multi-node server:
     a. Log in to the utility node as admin.
     b. Load the admin OpenSSH key by typing:

        ```
        ssh-agent bash
        ssh-add ~admin/.ssh/admin_key
        ```

     c. When prompted, type the \( \text{admin\_key} \) passphrase and press Enter.

2. Stop the MCS by typing `dpnctl stop mcs`.

3. Restore the MCS by typing one of the following commands:
   - To restore to the most recent backup, type `mcserver.sh --restore`.
   - To restore to a specific backup, type `mcserver.sh --restore --labelnum=n`, where \( n \) is the label number of the backup.

4. Open `/usr/local/avamar/var/mc/server_log/restore.log` to verify the success of the restore.

5. Start the MCS and the scheduler by typing:

   ```
   dpnctl start mcs
   dpnctl start sched
   ```

**Reverting to the default MCS configuration settings**

**Procedure**

1. Open a command shell and log in by using one of the following methods:
   - For a single-node server, log in to the server as admin.
   - For a multi-node server:
     a. Log in to the utility node as admin.
     b. Load the admin OpenSSH key by typing:

        ```
        ssh-agent bash
        ssh-add ~admin/.ssh/admin_key
        ```

     c. When prompted, type the \( \text{admin\_key} \) passphrase and press Enter.

2. Stop the MCS by typing `dpnctl stop mcs`.

3. Change the working directory by typing the following command:

   ```
   cd /usr/local/avamar/var/mc/server_data/prefs
   ```

4. Rename `mcserver.xml` to `old.mcserver.xml` by typing the following command:

   ```
   mv mcserver.xml old.mcserver.xml
   ```
5. Copy the default server preferences file to the current directory by typing the following command on a single command line:

```
cp /usr/local/avamar/lib/mcserver.xml /usr/local/avamar/var/mc/server_data/prefs/mcserver.xml
```

6. Start the MCS and the scheduler by typing:

```
dpnctl start mcs
dpnctl start sched
```

# Using network address translation (NAT)

Avamar clients can access Avamar storage nodes by using a set of addresses that undergo NAT.

To make NAT information available to the Avamar server, the `probe.xml` file must contain `nat-address` elements for storage nodes. After a client makes initial contact with the utility node on the Avamar server, the Avamar server provides a set of routable addresses for the storage nodes to each client. In the absence of a `nat-address` element, a client uses a pre-configured “real” (untranslated) network interface address.

The following figure illustrates an example of a 1x4 multi-node server configuration in which Avamar uses NAT.

![Multi-node server configuration with NAT](image)

The following instructions assume that each Avamar node has a unique address (from the Avamar client perspective), and that you configure a router on the network to apply transparent one-to-one network address translation. You can also use these instructions to enable NAT for use in a single-node server configuration.

**Procedure**

1. Use either the `dpnnetutil` or `nodedb` program to add NAT addresses to `probe.xml`.

<table>
<thead>
<tr>
<th>Command</th>
<th>Command prompt example</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>dpnnetutil</code></td>
<td><code>su - root</code></td>
</tr>
<tr>
<td></td>
<td><code>dpnnetutil</code></td>
</tr>
<tr>
<td></td>
<td>Respond to the interactive prompts displayed by <code>dpnnetutil</code>.</td>
</tr>
</tbody>
</table>
2. If the Avamar storage subsystem is stopped, restart it by typing `dpnctl start gsan`.

3. If the Avamar storage subsystem is running, reread the `probe.xml` file by typing the following command:

   ```bash
   avmaint networkconfig /usr/local/avamar/var/probe.xml --avamaronly
   ```

4. Register clients by using the `avregister` (UNIX) or `avregister.bat` (Windows) command, or by using Avamar Administrator.

### Solutions for common NAT problems

To determine whether NAT is in use, the client and Avamar server must have a network connection. The following table provides solutions for common NAT connection and configuration problems.

#### Table 43 Solutions for common NAT problems

<table>
<thead>
<tr>
<th>Problem</th>
<th>Solution</th>
</tr>
</thead>
</table>
| The Avamar server terminates with a FATAL ERROR message. | Ensure that the `probe.xml` file:  
  - Exists in the `/usr/local/avamar/var/` directory.  
  - Is a valid XML file and adheres to the node resource database format.  
  - Lists NAT IP addresses correctly.  
  Use the `nodedb print --say` command to view the contents of `probe.xml`. The `--say` option displays the path and name of the current node resource database. |
| The server/client connection fails. | Use network diagnostic tools such as `ping`, `traceroute`, `tracert`, or `iperf` to verify network connectivity. |

### Editing network settings for a single-node server

The *Changing the Name and IP Addressing of Avamar Systems Technical Note*, which is available on EMC Online Support at [https://support.EMC.com](https://support.EMC.com), provides instructions on how to edit the network settings for a single-node server.

### Adding a custom security notification for web browser logins

You can include a custom security notification on the login page of Avamar Web Restore. This notification typically explains that only authorized users are permitted access. It can also list the penalties for unauthorized access.

**Procedure**

1. In a text editor, create a file that is named `disclaimer_Web_Restore.txt`. 
2. Add the notification content to the file.
   You can use some basic HTML tags and CSS inline styles in the notification content.

3. Copy the file to the following location on a single-node server, or on the utility node of a multi-node server:
   
   /usr/local/avamar/var/em/server_data/

**Viewing and editing server contact information**

The Avamar server sends contact information for the Avamar server to EMC with every event it reports, including capacity reports that help prevent the system from exceeding critical thresholds. Keep this information current.

A server roll back applies the contact information that existed at the time of the checkpoint. When the roll back completes, you can view or edit the contact information to ensure that the information is current.

**Procedure**

1. In Avamar Administrator, select Help > View/Edit Contact Information.

   The View/Edit Contact Information dialog box appears. The fields in the following table are read-only on the dialog box.

   **Table 44** Read-only fields on the View/Edit Contact Information dialog box

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EMC site ID</td>
<td>Unique customer site identifier, which is specified during initial server installation. This field is read-only.</td>
</tr>
<tr>
<td>System ID</td>
<td>Unique Avamar server identifier, created during initial server installation. This field is read-only.</td>
</tr>
<tr>
<td>AVE</td>
<td>Yes (Y) if this server is an Avamar Virtual Edition (AVE) server or no (N) if it is not. This field is read-only.</td>
</tr>
</tbody>
</table>

2. Edit the contact information.

   **Table 45** Editable fields on the View/Edit Contact Information dialog box

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Data Domain S/N</td>
<td>Serial number of Data Domain systems that have been added to this server. If no Data Domain systems have been added, type (N/A).</td>
</tr>
<tr>
<td>Server location</td>
<td>Physical location of the Avamar server at the customer site.</td>
</tr>
<tr>
<td>Company Information</td>
<td>Name and address of the company that owns this Avamar server.</td>
</tr>
<tr>
<td>Contact Information</td>
<td>Name, telephone number, and email address of the primary contact for this Avamar server.</td>
</tr>
</tbody>
</table>

3. Click **OK**.
CHAPTER 8
Server Monitoring

This chapter includes the following topics:

- Recommended daily server monitoring............................................................... 174
- Monitoring activities .......................................................................................... 174
- Monitoring server status and statistics .............................................................. 176
- Event monitoring .................................................................................................. 188
- Server monitoring with syslog ........................................................................... 198
- Server monitoring with SNMP ......................................................................... 204
- Viewing Avamar server log files ........................................................................ 207
- Audit logging ........................................................................................................ 208
- Automatic notifications to EMC Customer Support ........................................... 209
- Verifying system integrity ................................................................................... 215
Recommended daily server monitoring

To ensure that the Avamar server is working properly, EMC recommends that you perform the system monitoring tasks listed in the following table on a daily basis.

Table 46 System monitoring tools and tasks

<table>
<thead>
<tr>
<th>Monitoring tool</th>
<th>Monitoring task</th>
</tr>
</thead>
<tbody>
<tr>
<td>Activity Monitor</td>
<td>Investigate any abnormal client activity, such as backups that complete with exceptions.</td>
</tr>
<tr>
<td>Server Monitor</td>
<td>Confirm that the last checkpoint and validated checkpoint are recent. Ideally, they should have occurred within the past 24 hours.</td>
</tr>
<tr>
<td>Event Monitor</td>
<td>Investigate any system errors or warnings.</td>
</tr>
<tr>
<td>Unacknowledged Events list</td>
<td>Investigate and clear (acknowledge) any unacknowledged events.</td>
</tr>
</tbody>
</table>

**NOTICE**

EMC recommends that you enable the Email Home feature and the ConnectEMC feature, which automatically email EMC Customer Service with the status of the daily data integrity check and other important server messages.

Monitoring activities

Procedure

1. In Avamar Administrator, click the Activity launcher button.

   The Activity window appears.

2. Click the Activity Monitor tab.

   *Activity Monitor details on page 174* provides details on the information available in the Activity Monitor.

3. (Optional) Filter the information in the Activity Monitor to display only activities with a specific state, type, group, client, or plug-in:

   a. Select Actions > Filter.

   The Filter Activity dialog box appears.

   b. Define the filtering criteria and click OK.

**Activity Monitor details**

By default, the Activity Monitor tab displays the most recent 5,000 client activities during the past 72 hours. You can increase or reduce the amount of information in the Activity Monitor by editing the `com.avamar.mc.wo.completed_job_retention_hours` preference in the `/usr/local/avamar/var/mc/server_data/prefs/mcsERVER.xml` file, and then restarting the MCS.

The following tables provide details on the information that is available in the Activity Monitor.
### Table 47 Session details available in the Activity Monitor

<table>
<thead>
<tr>
<th>Column</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status</td>
<td>Status of the backup, restore, or validation activity. The Avamar Administrator online help provides details on each status.</td>
</tr>
<tr>
<td>Error Code</td>
<td>If the activity did not successfully complete, a numeric error code appears. Double-click the error code to view a detailed explanation.</td>
</tr>
<tr>
<td>Start Time</td>
<td>Date and time that this activity began, adjusted for the prevailing time zone, which is shown in parentheses. Daylight Savings Time (DST) transitions are automatically compensated.</td>
</tr>
<tr>
<td>Elapsed Time</td>
<td>Elapsed time for this activity.</td>
</tr>
<tr>
<td>End Time</td>
<td>Date and time that this activity completed, adjusted for the prevailing time zone, which is shown in parentheses. Daylight Savings Time (DST) transitions are automatically compensated.</td>
</tr>
<tr>
<td>Type</td>
<td>Type of activity. The Avamar Administrator online help provides details on each type.</td>
</tr>
<tr>
<td>Server</td>
<td>Server on which the activity occurred, either the Avamar server or a Data Domain system.</td>
</tr>
<tr>
<td>Progress Bytes</td>
<td>Total number of bytes examined during this activity.</td>
</tr>
<tr>
<td>New Bytes</td>
<td>Percentage of new bytes backed up to either the Avamar server or a Data Domain system. Low numbers indicate high levels of data deduplication.</td>
</tr>
</tbody>
</table>

### Table 48 Client details available in the Activity Monitor

<table>
<thead>
<tr>

<tr>
<td>Schedule</td>
<td>If the activity was a scheduled backup, the schedule that began this activity. On-Demand or End User Request is shown for all other activities that are started from Avamar Administrator or the client, respectively.</td>
</tr>
<tr>
<td>Dataset</td>
<td>Name of the dataset that is used to create the backup. If the activity is a replication job, this column lists the source system name on the destination system, and the destination name on the source system.</td>
</tr>
<tr>
<td>WID</td>
<td>Work order ID. Unique identifier for this activity.</td>
</tr>
</tbody>
</table>

### Monitoring server status and statistics

The **Server** window in Avamar Administrator enables you to monitor status and statistics for the Avamar server as a whole, for individual nodes on the Avamar server, and for any configured Data Domain systems.

The following tabs appear on the **Server** window:

- The **Server Monitor** tab presents a summarized view of CPU, network, and hard drive performance statistics for the Avamar server. A separate subtab provides the same information for any configured Data Domain systems.
- The **Server Management** tab shows a detailed view of the server hardware resources for the Avamar server and any configured Data Domain systems.
- The **Session Monitor** tab shows a list of active client backup and restore sessions.
- The **Checkpoint Management** tab shows detailed information for all system checkpoints performed for this Avamar server.
• The Data Domain NFS Datastores tab lists the temporary NFS share for VMware instant access on any configured Data Domain systems. The *EMC Avamar for VMware User Guide* provides more information on instant access.

**Server Monitor tab**

The **Server Monitor** tab on the **Server** window in Avamar Administrator includes separate tabs for the Avamar server and any configured Data Domain systems.

**Avamar tab**

The **Avamar** tab in the Server Monitor presents a summarized view of CPU, network, and hard drive performance statistics for the Avamar server.

The following tables describe the information available on the **Avamar** tab.

**Table 50** Node details on the Avamar tab of the Server Monitor

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status indicators</td>
<td>Status of the node. One of the following values:</td>
</tr>
<tr>
<td></td>
<td>• Online (green)—The node is functioning correctly.</td>
</tr>
<tr>
<td></td>
<td>• Read-Only (blue)—This status occurs normally as background operations are</td>
</tr>
<tr>
<td></td>
<td>performed and when backups have been suspended.</td>
</tr>
<tr>
<td></td>
<td>• Time-Out (gray)—MCS could not communicate with this node.</td>
</tr>
<tr>
<td></td>
<td>• Unknown (yellow)—Node status cannot be determined.</td>
</tr>
<tr>
<td></td>
<td>• Offline (red)—The node has experienced a problem. If ConnectEMC has been</td>
</tr>
<tr>
<td></td>
<td>enabled, a Service Request (SR) is logged. Go to EMC Online Support to</td>
</tr>
<tr>
<td></td>
<td>view existing SRs. Search the knowledgebase for Avamar Data Node offline</td>
</tr>
<tr>
<td></td>
<td>solution esg112792.</td>
</tr>
<tr>
<td>ID</td>
<td>Each node in the Avamar server has a unique logical identifier. This node ID</td>
</tr>
<tr>
<td></td>
<td>is expressed in the format <em>module.node</em>.</td>
</tr>
</tbody>
</table>

**Note**

Module and node numbering begins with zero. Therefore, the ID for the third node in the first module is 0.2.

**Table 51** CPU details on the Avamar tab of the Server Monitor

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Load</td>
<td>Average number of CPU threads over the past minute.</td>

<td>Writes</td>
<td>Average number of hard drive writes per second as reported by the operating system.</td>
</tr>
<tr>
<td>Utilization</td>
<td>Percentage of total available server storage capacity currently used.</td>
</tr>
</tbody>
</table>

Data Domain tab

The Data Domain tab in the Server Monitor provides CPU, disk activity, and network activity for each node on the Data Domain system.

The following tables describe the information available on the Data Domain tab.

Table 54 Node details on the Data Domain tab of the Server Monitor

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status indicators</td>
<td>Status of the node. One of the following values:</td>
</tr>
<tr>
<td></td>
<td>• OK (green)—The Data Domain system is functioning correctly.</td>
</tr>
<tr>
<td></td>
<td>• Warning (yellow)—There is a problem with the Data Domain system, but backups and restores can continue.</td>
</tr>
<tr>
<td></td>
<td>• Error (red)—There is a problem with the Data Domain system, and backups and restores are stopped until the problem is resolved.</td>
</tr>
<tr>
<td>Name</td>
<td>Hostname of the Data Domain system as defined in corporate DNS.</td>
</tr>
</tbody>
</table>

If the status is yellow or red, you can view additional status information to determine and resolve the problem. The **EMC Avamar and EMC Data Domain System Integration Guide** provides details.

Table 55 CPU details on the Data Domain tab of the Server Monitor

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Busy Avg.</td>
<td>Average CPU usage as a percentage of total possible CPU usage.</td>
</tr>
<tr>
<td>Max</td>
<td>Maximum CPU usage that has occurred as a percentage of total possible CPU usage.</td>
</tr>
</tbody>
</table>

Table 56 Disk (KB/S) details on the Data Domain tab of the Server Monitor

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Read</td>
<td>Disk read throughput in kilobytes per second.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Write</td>
<td>Disk write throughput in kilobytes per second.</td>
</tr>
<tr>
<td>Busy</td>
<td>Disk I/O usage as a percentage of total possible disk I/O usage.</td>
</tr>
</tbody>
</table>

### Table 57 Network (KB/S) details on the Data Domain tab of the Server Monitor

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Eth#1</td>
<td>Desc—Description of the network interface. In/Out—Network bandwidth usage in kilobytes per second on network interface 1.</td>
</tr>
<tr>
<td>Eth#2</td>
<td>Desc—Description of the network interface. In/Out—Network bandwidth usage in kilobytes per second on network interface 2.</td>
</tr>
<tr>
<td>Eth#3</td>
<td>Desc—Description of the network interface. In/Out—Network bandwidth usage in kilobytes per second on network interface 3.</td>
</tr>
</tbody>
</table>

*a.* The number of Eth# columns depends on the maximum number of network interfaces that the configured Data Domain systems support.

---

**Server Management tab**

The **Server Management** tab on the **Server** window in Avamar Administrator shows a detailed view of the server hardware resources, including both the Avamar server and any configured Data Domain systems.

Avamar server information is listed under the **Avamar** folder in the tree, and configured Data Domain systems are listed under the **Data Domain** folder in the tree.

The information in the right pane of the window changes when you select different items in the tree.

### Table 58 Data display based on selections on the Server Management tab

<td>Detailed information for that Data Domain system</td>
</tr>
</tbody>
</table>

**NOTICE**

Avamar is licensed in decimal units. Therefore, **Total capacity** and **Capacity used** are displayed in decimal units on the **Server Management** tab. All other parts of the product that output capacity are displayed in binary units.

**Bytes Protected Summary**

The following table provides details on the **Bytes Protected Summary** properties on the **Server Management** tab.

Table 59 Bytes Protected Summary properties on the Server Management tab

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Properties</td>
<td>Name of the Avamar server and configured Data Domain systems.</td>
</tr>
<tr>
<td>Values</td>
<td>Number of bytes of protected data on the server or Data Domain system.</td>
</tr>
</tbody>
</table>

**Server information**

The following tables describe the **Server Information** that is provided when an Avamar server is selected on the **Server Management** tab.

Table 60 Server Details on the Server Management tab

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active sessions</td>
<td>Current number of active client sessions. Click the <strong>Session Monitor</strong> tab for more information.</td>
</tr>
<tr>
<td>Total capacity</td>
<td>Total amount of server storage capacity.</td>
</tr>
<tr>
<td>Server utilization</td>
<td>Percentage of total available server storage capacity currently used. This value is derived from the largest <strong>Disk Utilization</strong> value on the <strong>Avamar</strong> tab in the Server Monitor, and therefore represents the absolute maximum Avamar server storage utilization. Actual utilization across all modules, nodes, and drives might be slightly lower.</td>
</tr>
<tr>
<td>Bytes protected</td>
<td>Total amount of client data in bytes that has been backed up (protected) on this server.</td>
</tr>
<tr>
<td>Bytes protected quota</td>
<td>Maximum amount of client data in bytes that is licensed for protection on this server.</td>
</tr>
<tr>
<td>License expiration</td>
<td>Calendar date on which this server’s licensing expires. When the licensing is perpetual, the value is <strong>never</strong>.</td>
</tr>
</tbody>
</table>
### Table 60 Server Details on the Server Management tab (continued)

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Time since Server initialization</td>
<td>Number of hours, days, and minutes that have elapsed since this Avamar server was initialized.</td>
</tr>
<tr>
<td>Last checkpoint</td>
<td>Date and time that the last server checkpoint was performed. Checkpoints are typically performed twice daily.</td>
</tr>
<tr>
<td>Last validated checkpoint</td>
<td>Date and time that the server checkpoint was last validated. Checkpoint validation normally occurs once per day. Therefore, the Last validated checkpoint time and Last checkpoint time might be different depending on the time of day that you view this information.</td>
</tr>
<tr>
<td>Note</td>
<td>If the Last validated checkpoint and Last checkpoint times are more than 36 hours apart, checkpoint validation is not occurring, which is a problem.</td>
</tr>
<tr>
<td>System Name</td>
<td>User-assigned name of this Avamar server.</td>
</tr>
<tr>
<td>System ID</td>
<td>Unique identifier for this Avamar server.</td>
</tr>
<tr>
<td>HFSAddr</td>
<td>Hash File System (HFS) address (Addr). The hostname or IP address that backup clients use to connect to this Avamar server.</td>
</tr>
<tr>
<td>HFSPort</td>
<td>HFS data port. The data port that backup clients use to connect to this Avamar server. The default is port 27000.</td>
</tr>
<tr>
<td>IP Address</td>
<td>IP address of this Avamar server. If the HFSAddr is an IP address, this value is the same as the HFSAddr.</td>
</tr>
</tbody>
</table>

### Table 61 Maintenance Activities Details on the Server Management tab

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| Suspended| One of the following values:  
  - No — Server maintenance activities are not currently suspended (that is, server maintenance activities will run normally during the next maintenance window).  
  - Yes — Server maintenance activities are currently suspended. |

### Table 62 Garbage Collection Details on the Server Management tab

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| Status   | One of the following values:  
  - Idle — Garbage collection is not currently taking place.  
  - Processing — Garbage collection is taking place. |
| Result   | One of the following values:  
  - OK — Last garbage collection activity successfully completed. |
Table 62 Garbage Collection Details on the Server Management tab (continued)

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Error code</td>
<td>Last garbage collection activity did not successfully complete.</td>
</tr>
<tr>
<td>Start time</td>
<td>Date and time that the last garbage collection activity began.</td>
</tr>
<tr>
<td>End time</td>
<td>Date and time that the last garbage collection activity ended.</td>
</tr>
<tr>
<td>Passes</td>
<td>Total number of passes during the last garbage collection activity.</td>
</tr>
<tr>
<td>Bytes recovered</td>
<td>Total amount of storage space in bytes that was recovered during the last garbage collection activity.</td>
</tr>
<tr>
<td>Chunks deleted</td>
<td>Total number of data chunks that were deleted during the last garbage collection activity.</td>
</tr>
<tr>
<td>Index stripes</td>
<td>Total number of index stripes.</td>
</tr>
<tr>
<td>Index stripes processed</td>
<td>Total number of index stripes that were processed during the last garbage collection activity.</td>
</tr>
</tbody>
</table>

Module information

The following table provides details on the Module properties on the Server Management tab.

Table 63 Module properties on the Server Management tab

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Total capacity</td>
<td>Total amount of server storage capacity.</td>
</tr>
<tr>
<td>Server utilization</td>
<td>Percentage of total available server storage capacity currently used. This value is derived from the largest Disk Utilization value shown on the Avamar tab in the Server Monitor, and therefore represents the absolute maximum Avamar server storage utilization. Actual utilization across all modules, nodes and drives might be slightly lower.</td>
</tr>
<tr>
<td>Number of nodes</td>
<td>Total number of nodes in this module.</td>
</tr>
<tr>
<td>IP address</td>
<td>Base IP address of this module.</td>
</tr>
</tbody>
</table>

Node information

The following tables provide details on the Node properties on the Server Management tab.

Table 64 Status indicators on the Node Information part of Server Management

<table>

</table>

SNMP status, either:
- SNMP Enabled
- SNMP Disabled

Status of the Data Domain file system, either:
- File System Running
- File System Enabled
- File System Disabled
- File System Unknown
- File system status unknown since SNMP is disabled

Whether synchronization of maintenance operations, such as checkpoints, HFS checks, and Garbage Collection, between the Avamar server and the Data Domain system can occur, either:
- Synchronization of maintenance operations is off.
- Synchronization of maintenance operations is on.

---

**Event monitoring**

All Avamar system activity and operational status is reported as events to the MCS. Examples of Avamar events include client registration and activation, successful and failed backups, and hard disk status.

Each event contains the information in the following table.

Table 71 Event information

<table>
<thead>
<tr>
<th>Information</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Event code</td>
<td>Unique identifier</td>

</tr>
</tbody>
</table>

Summary | A one-line summary description of the event

Hardware source | System node that reported the event

Software source | System or application module that reported the event

Event notifications

The following features generate notifications when specific events occur.

**Pop-up alerts**
You can configure individual events to generate a graphical pop-up alert each time the event occurs. Avamar Administrator must be running for the pop-up alerts to appear.

**Acknowledgment required list**
You can specify that when a certain event type occurs, the Avamar system administrator must acknowledge the event.

**Email messages**
You can specify that when a certain event type occurs, an email message is sent to a designated list of recipients. Email notifications can be sent immediately or in batches at scheduled times.

A typical batch email notification message looks like the following example.

Table 72 Example of a batch email notification message

MCS: avamar-1.example.com

MCS Version: 7.1.0-nnn
Avamar Server: avamar-1.example.com
Avamar Server Version: 7.1.0-nnn

Event profile: My Custom Profile
Count of events: 3

Summary of events:
Type

Event Summary = Group modified  
Software Source = MCS:CR  

Syslog support

You can specify that when an event type occurs, Avamar logs information to local or remote syslog files that are based on filtering rules that are configured for the syslog daemon that receives the events. Third-party monitoring tools and utilities capable of examining log entries can access the syslog files and process them to integrate Avamar event information into larger site activity and status reports.

SNMP support

The Avamar SNMP implementation provides two ways to access Avamar server events and activity completion status:

- SNMP requests provide a mechanism for SNMP management applications to “pull” information from a remote SNMP-enabled client (in this case, the Avamar server).
- SNMP traps provide a mechanism for the Avamar server to “push” information to SNMP management applications whenever designated Avamar events occur. You can configure an event type to output SNMP traps.

Event profiles

Profiles are a notification management feature that are used to logically group certain event codes together and specify which notifications to generate when the events occur. There are two basic types of event profiles:
- **System profile** — There is only one system event profile. It contains all possible system event codes.
- **Custom profiles** — Custom profiles are used to send various notifications when certain system events occur. You can create as many custom profiles as you need to organize system events and generate notifications when any of those events occur.

**Profile catalog**

The Avamar system includes a set of preconfigured event profiles by default.

**System profile**
There is only one system event profile. It contains all possible system event codes.

**Evaluation profile**
The evaluation profile is primarily intended to be used to support system evaluations. If enabled, this profile generates an email notification and attaches two weeks’ worth of Activities - DPN Summary report information to the email message. The *EMC Avamar Reports Guide* provides more information about the Activities - DPN Summary report.

**High Priority Events profile**
The High Priority Events profile is enabled by default. This special event profile automatically emails the following information to EMC Customer Support (emailhome@avamar.com) twice daily:
- Status of the daily data integrity check
- Selected Avamar server warnings and information messages
- Any Avamar server errors

The only change you can make to the High Priority Events profile is to add email addresses to the Recipient Email List. If you require custom High Priority Events profile settings, copy the profile and then edit the copy.

**Local SNMP Trap profile**
The Local SNMP Trap profile is read-only and is intended to be used for test purposes only. The profile enables you to verify that traps are successfully generated and received by the local *snmptrapd* process, which then writes the trap information to a syslog file.

**Local Syslog profile**
If enabled, the Local Syslog profile reports status by way of the local *syslogd* process on the Avamar server.

**Editing the system event profile**
The system event profile contains all possible system event codes. You can edit the system event profile to control whether an event generates a pop-up alert in Avamar Administrator, an entry in the common unacknowledged events list, or neither.

**Procedure**
1. In Avamar Administrator, select **Tools > Manage Profiles**.
   
   The **Manage All Profiles** window appears.

2. Select **System Profile** in the left pane and click **Edit**.

   The **Edit Profile** dialog box appears with a list of event codes.

3. To show a graphical pop-up alert in Avamar Administrator each time an event occurs, select the **GUI Alert** checkbox next to the event.

4. To add an entry to the common unacknowledged events list each time an event occurs, select the **Acknowledgement Required** checkbox.
5. Click **OK**.

Creating a custom event profile

Custom event profiles enable you to send notifications when specific system events occur.

You cannot view system events and profiles outside the domain that you are logged in to. This affects the profiles that you can edit and the events that you can add to a profile.

**Procedure**

1. In Avamar Administrator, select **Tools > Manage Profiles**.
   
   The **Manage All Profiles** window appears.

2. In the left pane, select the domain for the custom event profile, and click **New**.
   
   The **New Profile** wizard appears.

3. In the **Profile Name** box, type a name for the event profile.

4. Choose whether to enable or disable the profile by selecting or clearing the **Profile Enabled** checkbox.

5. Choose whether to enable email notifications for the profile by selecting or clearing the **Email Enabled** checkbox.

6. If you enabled email notifications, then specify whether to send email notifications as soon as events occur or on a scheduled basis:

   - To send email notifications as soon as events occur, select **Send data as events occur**.
   - To send email notifications on a scheduled basis, select **Send data on a schedule**, and then select the schedule from the list.

7. Choose whether to enable or disable syslog notification for the profile by selecting or clearing the **Syslog Notification – Enabled** checkbox.

8. Choose whether to enable or disable SNMP notification for the profile by selecting or clearing the **SNMP Trap Notification – Enabled** checkbox.

9. Click **Next**.
   
   The **Event Codes** page appears.

10. Click the **All Codes** tab, and then select the **Notify** checkbox next to the errors that should trigger notifications.

    ![NOTE](image)

    An asterisk (*) next to an event indicates an event of such severity that a notification is sent when that event occurs, even if other event notifications are sent on a schedule.

11. Click the **Audit Codes** tab, and then select the **Notify** checkbox next to the audit events that should trigger notifications.

    ![NOTE](image)

    An asterisk (*) next to an event code indicates an event of such severity that a notification is sent when that event occurs, even if other event notifications are sent on a schedule.
12. If you are adding this custom event profile at the top-level (that is, not to a domain or subdomain), specify the parameters to control capacity forecast alerts:
   a. Click the Parameters tab.
   b. Select the checkbox next to the parameter, and then type a new value for the parameter.
   c. Repeat the previous step as necessary for each parameter.
13. Click Next.
   The Attachments page appears.
14. (Optional) If the profile includes email notification messages, select the Attach Server status in email (XML) checkbox to include a report of overall Avamar server status in XML format in the messages.
15. (Optional) To include Avamar server logs in email notification messages, select the Attach Server logs in email checkbox and then type the full path to the location of Avamar server logs in the Directory box. The default location is /usr/local/avamar/var/cron/.
16. Specify the reports to include in email notification messages:
   a. Select the Attach checkbox next to the report to include.
   b. Select the checkbox next to the report for the file formats in which to send the report. You can select XML, CSV, or TXT.
   c. Specify the number of historical reports of this type to send with each notification message using the Since Count and Since Unit fields. For example, send the past two months of these reports.
      The following values are available from the Since Count list:
      • day(s) ago
      • week(s) ago
      • month(s) ago
      • since last modified
17. Click Next.
   The Email Notification page appears.
18. If the profile includes email notification messages, then specify the recipients and options for the email notification messages:
   a. In the Email Subject Header box, type an email subject line for the notification message.
   b. Add an email recipient to the list by typing a valid email address in the Enter Recipient box and then clicking +.
   c. (Optional) To remove a recipient from the Recipient Email List, select the recipient and click -.
   d. To insert all attachments into the body of the email notification message, select the Inline attachments checkbox.

**NOTICE**

When you insert the attachments, the email message may be very long.
e. To immediately send a test email message, click **Send Email**.

   If the test email message is sent successfully, an Email accepted by transport layer confirmation message appears.

19. Click **Next**.

   The **Syslog Notification** page appears.

20. If the profile includes syslog notification messages, then specify the syslog notification parameters:

   a. In the **Address (IP or hostname)** box, type the IP address or hostname of the Avamar server node running the syslogd process.

   b. In the **Port Number** box, type the port number used for syslog communication.

   c. Choose whether to include extended event code information in the syslog message by selecting or clearing the **Include extended event data** checkbox.

   The extended information is delimited by using the following tags:

   ```
   <Code>
   <Type>
   <Severity>
   <Category>
   <HwSource>
   <Summary>
   <active>
   <lastEmailSendDate>
   <domain>
   <scheduleID>
   <num_prefs>
   <name>
   <isSystem>
   ```

   d. From the **Facility** list, select one of the following: `user, local0, local1, local2, local3, local4, local5, local6, or local7`.

   e. To test the syslog notification parameters, click **Send Test Syslog Entry**.

21. Click **Next**.

   The **SNMP Trap Notification** page appears.

22. If the profile includes SNMP notification messages, then specify SNMP notification parameters:

   a. In the **SNMP Trap address (IP or hostname)** box, type the IP address or hostname of the computer running an application that is capable of receiving and processing an SNMP trap.

   b. In the **Port Number** box, type the port number on the host machine that is listening for SNMP traps. The default data port is 162.

   c. In the **SNMP Community** box, type the name of the SNMP community that the SNMP trap listener is configured to use.

   The SNMP community is a text string that the local Net-SNMP agent uses to authenticate itself with the SNMP management application.

   d. To test the SNMP notification parameters, click **Send Test SNMP Trap**.

23. Click **Finish**.
Editing a custom event profile

After you create a custom event profile for notifications of specific system events, you can edit any of the properties of the profile.

You cannot view system events and profiles outside the domain that you are logged in to. This affects the profiles that you can edit and the events that you can add to a profile.

Procedure
1. In Avamar Administrator, select Tools > Manage Profiles.
   The Manage All Profiles window appears.
2. In the left pane, select the custom event profile and click Edit.
   The Edit Profile dialog box appears.
3. Edit the custom event profile. The properties are the same as when you create the profile.
4. Click OK.

Copying a custom event profile

You can create a custom event profile with the same properties as a profile that you already created by copying the profile. You can copy the profile to the same domain or to a different domain.

Procedure
1. In Avamar Administrator, select Tools > Manage Profiles.
   The Manage All Profiles window appears.
2. In the left pane, select the profile and click Copy.
   The Save As dialog box appears.
3. Type a name for the new custom event profile in the Save As box.
4. (Optional) To copy the new custom event profile to a different domain, click the ... button, browse to the new domain, and then click OK.
5. Click OK.

Testing custom event profile notifications

You can test custom event profile notification mechanisms by sending a short email message or writing a short message to the syslog file.

Procedure
1. In Avamar Administrator, select Tools > Manage Profiles.
   The Manage All Profiles window appears.
2. In the left pane, select the custom event profile and click Edit.
   The Edit Profile dialog box appears.
3. Test the custom event profile:
   - To send a test email message, select the Email Notification tab and click Send Email.
   - To write a test message to the syslog file, select the Syslog Notification tab and click Send Test Syslog Entry.
To send a test SNMP trap message, select the **SNMP Trap Notification** tab and click **Send Test SNMP Trap**.

If the test message is successfully sent, a confirmation message appears.

4. Click **OK**.
5. Click **OK** to close the **Edit Profile** dialog box.

**Enabling and disabling a custom event profile**

When you disable an event profile, no email notifications are sent until you reenable the profile. You can disable any profile except the system events profile.

**Procedure**

1. In Avamar Administrator, select **Tools > Manage Profiles**.
   
   The **Manage All Profiles** window appears.

2. In the left pane, select the event profile.

3. Click **Disable** to disable the event profile, or **Enable** to enable the event profile.

**Deleting a custom event profile**

You can permanently delete any custom event profile except the system events profile.

**Procedure**

1. In Avamar Administrator, select **Tools > Manage Profiles**.
   
   The **Manage All Profiles** window appears.

2. Select the event profile and click **Delete**.

   A confirmation message appears.

3. Click **Yes**.

**Viewing events in the Event Monitor**

**Procedure**

1. In Avamar Administrator, click the **Administration** launcher button.

   The **Administration** window appears.

2. Click the **Event Management** tab.

3. Click the **Event Monitor** tab near the bottom of the window.

   The Avamar Administrator online help provides details on each of the columns in the Event Monitor.

4. Select the display mode for the Event Monitor:

   - Select **Query** to display the most recent 5,000 system events for a defined range of dates.
   - Select **Monitor** to display the most recent 5,000 system events during the past 24 hours.

5. (Optional) Filter the events that appear in the Event Monitor:

   a. Open the **Actions** menu and select **Event Management > Filter**.

   The Filter dialog box appears.

   b. If you selected the **Query** display mode for the Event Monitor, select the range of dates for the events to display by using the **From Date** and **To Date** fields.
c. From the **Category** list, select the category of events to display.

d. From the **Type** list, select the type of events to display.

e. From the **Severity** list, select the severity of the events to display.

f. To view events for all domains, select **All Domains**. Or, to view events for a specific domain, select **Domain** and then browse to or type the domain name.

g. To display only events that contain certain case-sensitive keywords in the event code data XML element, type the keyword in the **Data** box.

   This criterion promotes easy filtering on important keywords across event attributes. For example, filtering the Event Monitor on `error` returns all events that contain the word `error` in any XML attribute (for example, category, type, or severity).

h. Choose whether to display events from all sources, from only the Avamar server, from all Data Domain systems, or from a single Data Domain system:

   • To view events from all sources, leave the default selection of **All Sources** in the **Source** list.
   • To view events from only the Avamar server, select **Avamar** from the **Source** list.
   • To view events from all Data Domain systems, select **Data Domain Systems** from the **Source** list and leave the default selection of **All Systems**.
   • To view events from a single Data Domain system, select **Data Domain Systems** from the **Source** list, select the **System** option, and then either type or browse to the Data Domain system.

i. Click **More** to view additional filtering criteria.

j. To limit the Event Monitor to events with a certain event code, select **Only include codes** and then add and remove codes from the list. Or, to exclude events with a certain event code from the Event Monitor, select **Exclude codes** and then add and remove codes from the list.

k. Click **OK**.

### Viewing the event catalog

A sequential listing of all event codes and summary information is available in `/usr/local/avamar/doc/event_catalog.txt` on the Avamar server. You can also view `event_catalog.txt` by using a web browser.

**Procedure**

1. Open a web browser and type the following URL:
   
   `http://Avamar_server`

   where `Avamar_server` is the DNS name or IP address of the Avamar server.

   The **EMC Avamar Web Restore** page appears.

2. Click **Documentation**.

   The **Avamar Documentation** page appears.

3. Click the plus icon next to **Avamar Event Codes**.

4. Click `event_catalog.txt`.

   The file opens in the web browser.
Acknowledging system events

System events that are configured to require acknowledgment each time they occur, remain in the unacknowledged events list until they are explicitly cleared, or acknowledged, by an Avamar server administrator.

Procedure

1. In Avamar Administrator, click the Administration launcher button. The Administration window appears.
2. Click the Event Management tab.
3. Click the Unacknowledged Events tab near the bottom of the window.
4. Acknowledge the events:
   - To acknowledge one or more events, select the event entries and select Actions > Event Management > Acknowledge Unacknowledged Events.
   - To acknowledge all events in the list, select Actions > Event Management > Clear All Alerts.

Customizing error events

By default, Avamar software continually monitors /var/log/messages for any occurrence of the case-insensitive search string error. Any occurrences of error create an event code of the type ERROR. You can customize this default behavior.

Procedure

1. Define additional case-insensitive search strings that also create Avamar ERROR events.
2. Add the search strings to /usr/local/avamar/var/mc/server_data/adminlogpattern.xml.

Server monitoring with syslog

The syslog system logging feature on UNIX and Linux systems collects system log messages and writes them to a designated log file. You can configure the Avamar server to send event information in syslog format.

The Avamar server supports both syslog and syslog-ng implementations.

Note

Persons configuring syslog monitoring of an Avamar server should be familiar with basic syslog concepts. A complete discussion of basic syslog concepts and implementation is beyond the scope of this guide. The www.syslog.org website provides additional information.

At the operating system level, system monitoring and logging relies on the syslogd process to collect system log messages and write them to a designated log file. The syslogd process runs locally on every Avamar server node.

However, without additional configuration, each node's syslogd only collects system information for that node, and writes it to a local log file on that node. From a syslog perspective, each Avamar server node is unaware that any other server nodes exist. Also, the utility node syslogd process is not aware that the Avamar Management Console Server (MCS) is collecting and logging Avamar event information.
You can configure an Avamar event profile to format Avamar server event messages in syslog format and send this data to the `syslogd` process running on the Avamar server utility node.

The following table describes how an event profile maps Avamar server event data to syslog fields.

**Table 73** Mappings of syslog fields to Avamar event data

<table>
<thead>
<tr>
<th>Field in syslog</th>
<th>Avamar event data</th>
</tr>
</thead>
<tbody>
<tr>
<td>Facility</td>
<td>Either <strong>User</strong> or <strong>Local</strong>#, where # is a number from 0 to 7.</td>
</tr>
<tr>
<td>Priority</td>
<td>One of the following values, which are based on the Avamar event type:</td>
</tr>
<tr>
<td></td>
<td>- <strong>debug</strong>, if the Avamar event type is <strong>DEBUG</strong></td>
</tr>
<tr>
<td></td>
<td>- <strong>err</strong>, if the Avamar event type is <strong>ERROR</strong></td>
</tr>
<tr>
<td></td>
<td>- <strong>info</strong>, if the Avamar event type is <strong>INFO</strong></td>
</tr>
<tr>
<td></td>
<td>- <strong>none</strong>, if the Avamar event type is <strong>INTERNAL</strong></td>
</tr>
<tr>
<td></td>
<td>- <strong>warning</strong>, if the Avamar event type is <strong>WARNING</strong></td>
</tr>
<tr>
<td>Date</td>
<td>Avamar event date.</td>
</tr>
<tr>
<td>Time</td>
<td>Avamar event time.</td>
</tr>
<tr>
<td>Hardware source</td>
<td>Avamar event hardware source.</td>
</tr>
<tr>
<td>Software source</td>
<td>Avamar event software source.</td>
</tr>
<tr>
<td>Message</td>
<td>The following fields from the Avamar event code:</td>
</tr>
<tr>
<td></td>
<td>- <strong>event code</strong></td>
</tr>
<tr>
<td></td>
<td>- <strong>category</strong></td>
</tr>
<tr>
<td></td>
<td>- <strong>summary</strong></td>
</tr>
<tr>
<td></td>
<td>- <strong>event data</strong></td>
</tr>
</tbody>
</table>

### Configuring local syslog

The most basic way to implement Avamar server syslog monitoring is to configure the MCS to output Avamar event information to the local `syslogd` process running on the utility node. The local `syslogd` service merges the Avamar event information with the operating system messages in a single local log file.

**Procedure**

1. Enable the Local Syslog event profile on the Avamar server:
   a. In Avamar Administrator, select **Tools > Manage Profiles**.
   b. Select the **Local Syslog** event profile in the left pane and click **Enable**.

2. On single-node servers and utility nodes with SLES 11 or later, configure the local utility node syslogd process to listen for MCS event messages on UDP data port 514:
   a. Open a command shell and log in as admin on the single-node server or the utility node of a multi-node server.
   b. Switch user to root by typing `su -`. 
c. Open /etc/syslog-ng/syslog-ng.conf in a text editor.

d. Locate the following entry:

```
# uncomment to process log messages from network:
# udp(ip("0.0.0.0") port(514));
```

e. Add the following entry, including the comment:

```
# uncomment to process log messages from MCS:
udp(ip("0.0.0.0") port(514));
```

f. Save and close the file.

g. Restart the syslog process by typing the following command:

```
service syslog restart
```

h. Verify that syslog is listening on port 514 by typing the following command:

```
netstat -nap | grep 514
```

The following output appears in the command shell:

```
udp 0 0 127.0.0.1:514 127.0.0.1:* 8043/syslog-ng
```

### Configuring remote syslog

Remote syslog monitoring involves configuring each server node to send syslog data to a remote logging host, and creating a custom syslog event profile that sends Avamar server event messages in syslog format to the remote logging host.

EMC expects that sites implementing remote syslog monitoring of an Avamar server will in most cases already have a remote logging host configured and deployed.

Many different syslog monitoring tools are available. Any syslog monitoring tool will generally work with Avamar as long as it is configured to listen for remote syslog messages over a LAN connection on UDP data port 514.

For maximum security, EMC recommends implementing remote syslog monitoring.

### Procedure

1. Create a custom syslog event profile that sends Avamar server event messages in syslog format to the remote logging host.
2. Configure all server nodes to send syslog messages to the remote logging host.
3. Configure the remote logging host to listen for syslog messages over a LAN connection on UDP data port 514.
4. If a firewall is enabled on the remote logging host, configure the firewall to allow UDP traffic on port 514 for a defined IP range.
Creating a custom syslog event profile

Procedure

1. In Avamar Administrator, select **Tools > Manage Profiles**.
   The **Manage All Profiles** window appears.
2. Select the **Local Syslog** event profile in the left pane and click **Copy**.
   The **Save As** dialog box appears.
3. Type a name for the new custom event profile in the **Save As** field.
4. Leave the domain set to root (/). Custom syslog profiles must reside in the root domain.
5. Click **OK**.
6. In the **Manage All Profiles** dialog box, select the custom syslog event profile that you created and click **Edit**.
   The **Edit Profile** dialog box appears.
7. Select the **Syslog Notification** tab and specify syslog notification parameters:
   a. In the **Address (IP or hostname)** field, type the IP address or hostname of the remote logging host.
   b. In the **Port Number** field, leave the port number set to **514**.
   c. Select the **Include extended event data** option to include extended event code information in the syslog message.
      The extended information is delimited by using the following tags:
      
      ```
      <Code>
      <Type>
      <Severity>
      <Category>
      <HwSource>
      <Summary>
      <active>
      <lastEmailSendDate>
      <domain>
      <scheduleID>
      <num_prefs>
      <name>
      <isSystem>
      ```
   d. From the **Facility** list, select one of the following values: **user**, **local0**, **local1**, **local2**, **local3**, **local4**, **local5**, **local6**, or **local7**.
8. (Optional) To test the syslog notification parameters, click **Send Test Syslog Entry**.
9. Click **OK**.
Configuring server nodes to send syslog messages to the remote logging server

As part of the process to configure remote syslog, you must configure all Avamar server nodes to send syslog messages to a remote logging server over a LAN connection on UDP data port 514.

Procedure
1. Open a command shell and log in by using one of the following methods:
   - For a single-node server:
     a. Log in to the server as admin.
     b. Switch user to root by typing `su -`.
   - For a multi-node server:
     a. Log in to the utility node as admin.
     b. Load the dpnid OpenSSH key by typing:

```
ssh-agent bash
ssh-add ~admin/.ssh/dpnid
```

   c. When prompted, type the dpnid passphrase and press Enter.
2. Open `/etc/syslog-ng/syslog-ng.conf` in a text editor.
3. Add the following entry:

```
destination logserver {udp("ip_address" port(514)); };
log { source(src); destination(logserver); };
```

where `ip_address` is the IP address of the remote logging host.
4. Save and close the file.
5. Restart the syslog process by typing the following command:

```
service syslog restart
```
6. On multi-node servers, repeat the previous steps for each node.

Configuring RHEL remote logging hosts running syslog

Procedure
1. Open a command shell and log in to the remote logging host as root.
2. Open `/etc/sysconfig/syslog` in a text editor.
3. Locate the following entry:

```
SYSLOGD_OPTIONS="-m 0"
```
4. Add the `-r` parameter to the entry:

```
SYSLOGD_OPTIONS="-r -m 0"
```
5. Save and close the file.
6. Restart the `syslogd` process by typing the following command:

```
service syslog restart
```
Configuring SLES remote logging hosts running syslog-ng

Procedure
1. Open a command shell and log in to the remote logging host as root.
2. Open /etc/syslog-ng/syslog-ng.conf in a text editor.
3. Locate the following entry:
   
   ```
   #
   # uncomment to process log messages from network:
   #
   udp(ip("0.0.0.0") port(514));
   ```
4. Uncomment the entry:
   
   ```
   #
   # uncomment to process log messages from network:
   #
   udp(ip("0.0.0.0") port(514));
   ```
5. Save and close the file.
6. Restart the syslog process by typing the following command:
   ```
   service syslog restart
   ```
7. Verify that syslog is listening on port 514 by typing the following command:
   ```
   netstat -nap | grep 514
   ```
   The following output appears in the command shell:
   ```
   udp 0 0 0.0.0.0:514 0.0.0.0:* 8043/syslog-ng
   ```

Configuring the firewall on the remote logging host

If a firewall is enabled on the remote logging host, configure the firewall to allow UDP traffic on port 514 for a defined IP range.

Procedure
1. Restrict the source IP addresses of the remote log messages in iptables or another firewall to avoid Denial Of Service (DOS) attacks on the remote logging host.

   The following example rule for iptables would allow client system logs for an IP address range of Avamar server nodes:
   ```
   # Rules to allow remote logging for syslog(-ng) on the log
   HOST system
   iptables -A INPUT -p udp -s 192.168.1.0/24 --dport 514 -j ACCEPT
   ```
   where 192.168.1.0/24 is in the IP address range of the Avamar server nodes.

   The following example rule for iptables specifies the IP address for each Avamar server node on a single line and includes the Mac address of the Network Interface Card (NIC) for the node:
   ```
   ```
   ```
   ```
Server monitoring with SNMP

Simple Network Management Protocol (SNMP) is a protocol for communicating and monitoring event notification information between an application, hardware device, or software application and any number of monitoring applications or devices.

Note

Persons configuring an Avamar server to send event information over SNMP should be familiar with basic SNMP concepts. A complete discussion of basic SNMP concepts and implementation is beyond the scope of this guide. The www.net-snmp.org website provides additional information.

The Avamar SNMP implementation provides SNMP requests and SNMP traps to access Avamar server events and activity status.

SNMP requests

SNMP requests provide a mechanism for SNMP management applications to “pull” information from a remote SNMP-enabled application or device (in this case, the Avamar server). The SNMP management application sends a request to an SNMP master agent running on the Avamar server. The SNMP master agent then communicates with the Avamar SNMP sub-agent, which passes the request to the MCS. The MCS retrieves the data and sends it back to the Avamar SNMP sub-agent, which passes it back to the management application by way of the SNMP master agent. Data port 161 is the default data port for SNMP requests.

Avamar servers that are purchased directly from EMC use the Net-SNMP master agent. Avamar servers that are built with other industry standard hardware likely use an SNMP master agent that is provided by the hardware manufacturer.

SNMP traps

SNMP traps provide a mechanism for the Avamar server to “push” information to SNMP management applications when designated Avamar events occur. Data port 162 is the default data port for SNMP traps. Typically, the SNMP management application listens for the SNMP traps that designated remote hosts generate.

Configuring server monitoring with SNMP

Procedure

1. To enable an SNMP management application to monitor an Avamar server, load the Avamar Management Information Base (MIB) definition file (AVAMAR-MCS-MIB.txt) into the master MIB used by the SNMP management application.
The MIB contains definitions of the information that can be monitored or which traps are sent for each SNMP application or device.

The following table provides the locations for the Avamar MIB definition file.

<table>
<thead>
<tr>
<th>Computer type</th>
<th>MIB location</th>
</tr>
</thead>
<tbody>
<tr>
<td>Single-node server</td>
<td>/usr/local/avamar/doc</td>
</tr>
<tr>
<td>Multi-node server</td>
<td>/usr/local/avamar/doc on the utility node</td>
</tr>
<tr>
<td>Computer with Avamar</td>
<td>install_dir/doc, where install_dir is typically:</td>
</tr>
<tr>
<td>Administrator</td>
<td>• C:\Program Files\avs\administrator on Microsoft</td>
</tr>
<tr>
<td></td>
<td>• /usr/local/avamar on Linux computers</td>
</tr>
<tr>
<td></td>
<td>• /opt/AVMRcns1 on Solaris computers</td>
</tr>
</tbody>
</table>

A copy of the Avamar MIB definition file also resides in the /usr/share/snmp/mibs directory on single-node servers and utility nodes. This copy is used by the Avamar SNMP sub-agent and should not be moved or distributed.

2. Install and configure an AgentX compliant master agent:
   - If the Avamar server was purchased directly from EMC, the Net-SNMP master agent is already installed, but the Net-SNMP agent must be configured. Configuring the Net-SNMP agent on page 205 provides instructions.
   - If the Avamar server is built with other industry standard hardware, install and configure the AgentX compliant master agent that is provided by the hardware vendor.

3. Configure a custom event profile to output designated Avamar server events to an SNMP trap. Creating a custom event profile for an SNMP trap on page 207 provides instructions.

Configuring the Net-SNMP agent

The `avsetup_snmp` command line utility configures the Net-SNMP agent to communicate with the Avamar server by using the Avamar SNMP sub-agent.

Procedure

1. Open a command shell and log in by using one of the following methods:
   - For a single-node server:
     a. Log in to the server as admin.
     b. Switch user to root by typing `su -`.
   - For a multi-node server:
     a. Log in to the utility node as admin.
     b. Load the dpnid OpenSSH key by typing:
        ```
        ssh-agent bash
        ssh-add ~admin/.ssh/dpnid
        ```
     c. When prompted, type the dpnid passphrase and press Enter.
2. Type the following commands to launch the utility:
   
   ```
   cd /root
   avsetup_snmp
   ```
   
The output prompts you to specify the port on which to listen for SNMP requests.

3. Specify the SNMP request data port:
   
   - To use port 161, the default SNMP request data port, press Enter.
   - To use a different SNMP request data port, type the data port number and press Enter.
   
   If `avsetup_snmp` was not able to detect any SNMP communities, the output prompts you to specify whether to allow SNMPv3 read-write user based access.

4. Type `n` and press Enter.
   
The output prompts you to specify whether to allow SNMPv3 read-only user based access.

5. Type `n` and press Enter.
   
The output prompts you to specify whether to allow SNMPv1/v2c read-write community access.

6. Type `n` and press Enter.
   
The output prompts you to specify whether to allow SNMPv1/v2c read-only community access.

7. Press Enter to accept the default value of `y`.
   
The output prompts you to specify the community name to which to add read-only access. The SNMP community is a text string that the local Net-SNMP agent uses to authenticate itself with the SNMP management application.

8. Type the SNMP community name and press Enter.
   
The output prompts you to specify the hostname or network address from which to accept this community name.

9. Press Enter to accept the community name from all hostnames or network addresses.
   
The output prompts you to specify the OID to which this community should be restricted.

10. Press Enter to specify no restriction.
   
The output prompts you to specify whether to configure another community.

11. Type `n` and press Enter.
   
The output indicates that `/etc/snmp/snmpd.conf` was created and run to configure the system_setup group. Then the output prompts you to specify the location of the system.

12. Type the physical location of the Avamar server and press Enter.
   
The output prompts you to specify contact information.

13. Type contact information (for example, email address, telephone extension, and so forth) and press Enter.
   
The output prompts you to specify whether to properly set the value of the `sysServices.0` OID.

14. Type `n` and press Enter.
The output indicates that /etc/snmp/snmpd.conf was installed and that snmpd was enabled.

Creating a custom event profile for an SNMP trap

As part of the process of configuring server monitoring with SNMP, create a custom event profile to output designated Avamar server events to an SNMP trap.

The default Avamar configuration includes a Local SNMP Trap profile that outputs Avamar server event messages to the local Net-SNMP trap listener (snmptrapd process). However, you cannot edit the Local SNMP Trap profile. The profile is intended to be used for test purposes only, to verify that the local snmptrapd process can successfully generate and receive the traps. The process then writes the trap information to a syslog file. Usually, the next step is to configure another custom profile to send Avamar SNMP traps to a remote Net-SNMP trap listener.

Procedure

1. Create a custom event profile by using the steps in Creating a custom event profile on page 192.
   On the first page of the New Profile wizard, select the option to enable SNMP trap notification.

2. Continue through the wizard until the SNMP Trap Notification page appears.

3. In the SNMP Trap Address (IP or hostname) box, type the IP address or hostname of a computer with an application capable of receiving and processing an SNMP trap.

4. In the Port Number box, type the port number on the host computer that listens for SNMP traps.

5. In the SNMP Community box, type the name of the SNMP community that the SNMP trap listener is configured to use.

6. (Optional) To test the SNMP notification parameters, click Send Test SNMP Trap.

7. Click Finish.

Viewing Avamar server log files

By default, the Avamar storage process log file (gsan.log) is limited to 25 MB in size and always contains the most recent information. Additional historic log files (for example, gsan.log.1, gsan.log.2, and so forth) might also exist. You can collect and view these log files by using command line operations.

Procedure

1. Open a command shell and log in by using one of the following methods:
   • For a single-node server, log in to the server as admin.
   • For a multi-node server:
     a. Log in to the utility node as admin.
     b. Load the admin OpenSSH key by typing:

        ```bash
        ssh-agent bash
        ssh-add ~admin/.ssh/admin_key
        ```
     c. When prompted, type the admin_key passphrase and press Enter.

2. Create a new user-defined temporary directory and change directory to it by typing the following commands:
mkdir directory

cd directory

where directory is the directory name.

3. Retrieve copies of the storage node log files by typing the following command:

getlogs

The getlogs command gathers the important log files from a particular node, compresses them into a single tar file, nodelogs.tgz, then copies these files to numbered subdirectories in the current working directory.

4. Examine the nodelogs.tgz files for any entry that contains the string ERROR. To accomplish this, run the following shell commands, which write any nodelogs.tgz entries that contain the string ERROR to a user-defined temporary file:

   for p in [01]![sm]*/nodelogs.tgz; do
tar xzf $p
grep ERROR: cur/gsan.log*
rm -rf cur/*
done

5. Remove the user-defined temporary directory by typing the following commands:

   cd ../
   rm -rf directory

Audit logging

The audit log keeps a permanent log of system actions initiated by users. The data in this log enables enterprises that deploy Avamar to enforce security policies, detect security breaches or deviation from policies, and hold users accountable for those actions.

Only actions that are initiated by users are logged. Actions initiated by the system without a user account, such as scheduled backups, maintenance activities, and so forth, are not logged.

System events with a category of SECURITY and type of AUDIT are used to implement the Avamar audit logging feature. Because the underlying data for audit log entries are system events, this information is available in two places:

- Event Monitor, which also contains all other system events
- Audit Log, which only contains events that are also audit log entries

By default, audit log information is retained for one year.

You can increase or reduce the audit log retention period by editing the value of clean_db_audits_days in /usr/local/avamar/var/mc/server_data/prefs/mcseserver.xml, and restarting the MCS.

Viewing the Audit Log

Procedure

1. In Avamar Administrator, click the Administration launcher button.

   The Administration window appears.
2. Click the **Event Management** tab.

3. Click the **Audit Log** tab near the bottom of the window.

   The Avamar Administrator online help provides details on each of the columns in the Audit Log.

4. Select the display mode for the Audit Log:
   - Select **Query** to display the most recent 5,000 audit log entries for a defined range of dates.
   - Select **Monitor** to display the most recent 5,000 audit log entries during the past 24 hours.

5. (Optional) Filter the entries that appear in the Audit Log:
   a. Open the **Actions** menu and select **Event Management > Filter**.
      The Filter dialog box appears.
   b. If you selected the **Query** display mode for the Audit Log, select the range of dates for the entries to display by using the **From Date** and **To Date** fields.
   c. From the **Severity** list, select the severity of the log entries to display.
   d. To view log entries for all domains, select **All Domains**. Or, to view entries for a specific domain, select **Domain** and then browse to or type the domain name.
   e. To display only log entries that contain certain case-sensitive keywords in the audit log entry data XML element, type the keyword in the **Data** box.
      This criterion promotes easy filtering on important keywords across log entry attributes. For example, filtering the log in **error** returns all log entries that contain the word **error** in any XML attribute (for example, category, type, or severity).
   f. Click **More** to view additional filtering criteria.
   g. To limit the Audit Log to events with a certain event code, select **Only include codes** and then add and remove codes from the list. Or, to exclude events with a certain event code from the Audit Log, select **Exclude codes** and then add and remove codes from the list.
   h. Click **OK**.

### Automatic notifications to EMC Customer Support

The Email Home and ConnectEMC features automatically send notifications to EMC Customer Support. These notifications include alerts for high priority events and daily reports to facilitate monitoring the Avamar server.

#### Email Home

The Avamar Email Home feature automatically sends configuration, capacity, and general system information to EMC Customer Support once daily, and provides critical alerts in near-real time as needed.

By default, notification schedule email messages are sent at 6 a.m. and 3 p.m. each day. The Notification Schedule controls the timing of these messages. [Schedules on page 95](#) provides more information on editing schedules.
Editing Email Home mail settings

Email Home is configured and enabled during Avamar server installation. You can edit the mail settings for Email Home after the installation.

Procedure

1. Open a command shell and log in by using one of the following methods:
   - For a single-node server, log in to the server as admin.
   - For a multi-node server:
     a. Log in to the utility node as admin.
     b. Load the admin OpenSSH key by typing:
        ```
        ssh-agent bash
        ssh-add ~/.ssh/admin_key
        ```
     c. When prompted, type the `admin_key` passphrase and press Enter.

2. Change directories by typing the following command:
   ```
   cd /usr/local/avamar/var/mc/server_data/prefs
   ```

3. Open `mcserver.xml` in a UNIX text editor.

4. Find the `com.avamar.asn.module.mail` node.
   The `com.avamar.asn.module.mail` node contains the `smtpHost` and `admin_mail_sender_address` entries.

5. Verify that the value for the `smtpHost` entry is the DNS name of the outgoing SMTP mail server that is used to send Email Home messages, such as `smtp.example.com`.
   If the value for the entry is incorrect, edit the value.

   **NOTICE**
   The Avamar 6.0 and later server installation or upgrade automatically completes the value for the `smtpHost` entry. In most cases, some arrangement must be made to enable emails originating from the Avamar server to be forwarded through the outgoing SMTP mail server to EMC Customer Support over the Internet.

6. Specify a valid email address with access to a corporate outgoing SMTP mail server as the value for the `admin_mail_sender_address` entry.

   **NOTICE**
   If you do not configure the Email Home feature to send messages from a valid email address, messages generated by the Email Home feature are rejected by the EMC incoming email server. EMC Customer Support is completely unaware that these programmatically generated messages were rejected. In addition, because a valid sending email account is not known, programmatically-generated warnings to the sender that these messages could not be sent are never viewed by anyone who can correct the problem.

7. Save the changes and close the file.

8. Restart the MCS by typing the following commands:
dpnctl stop mcs
dpnctl start

9. Close the command shell.

ConnectEMC

ConnectEMC is a program that runs on the Avamar server and sends information to EMC Customer Support. ConnectEMC is typically configured to send alerts for high priority events as they occur, as well as reports once daily.

ConnectEMC is integrated with EMC Secure Remote Support (ESRS), provided that it is installed, operational, and network accessible by the Avamar server. Contact your EMC Sales Representative for additional information about implementing ESRS.

Although ConnectEMC is initially configured during Avamar server software installation, Avamar Administrator enables you to manage ConnectEMC settings, in the form of three user-configurable transports, after the server is operational:

- Primary transport
- Failover transport
- Notification transport

The primary and failover transports send alerts for high priority events as they occur. The primary transport is used unless it fails, at which time the failover transport is used.

The notification transport sends email notifications messages to one or more customer email addresses under certain conditions.

You also can control whether the MCS generates and sends ConnectEMC messages by enabling, disabling, stopping, and starting ConnectEMC.

Enabling and disabling ConnectEMC

Disabling ConnectEMC causes the MCS to stop generating ConnectEMC messages until ConnectEMC is reenabled. To allow the MCS to continue generating ConnectEMC messages but to queue the messages, stop ConnectEMC.

Procedure

1. In Avamar Administrator, select Tools > Manage ConnectEMC.

   The Manage ConnectEMC window appears.

2. Specify whether the MCS generates and sends ConnectEMC messages:

   - To stop the MCS from generating messages, click Disable.
   - To restart the generation of messages, click Enable.
   - To continue generating messages but queue the messages, click Stop.
   - To start sending the messages, click Start.

   If you disable ConnectEMC, you are prompted to type a password.

3. Type a valid password and click OK.

Editing the primary and failover transports

Procedure

1. In Avamar Administrator, select Tools > Manage ConnectEMC.

   The Manage ConnectEMC window appears.
2. Select either **Primary Transport** or **Failover Transport** in the left pane, and click **Edit**. The **Edit Primary/Secondary Transport** dialog box appears.

3. Select the transport type from the **Transport Type** list:
   - Email
   - FTP
   - HTTPS

**Note**

An operational EMC Secure Remote Support gateway is required to use the FTP or HTTPS transport types.

4. (Email only) After selecting **Email**, complete the following steps.
   a. In the **SMTP Host (Email Server)** field, specify the mail server hostname or IPv4 address.
   b. In the **Email Address** field, specify one or more recipients of these email messages. Separate multiple email addresses with commas.
   c. In the **Email Sender Address** field, specify the email address from which to send the message.
   d. (Optional) To configure advanced settings, click **Advanced**, and then specify the following settings in the **Edit Advanced Email Settings** dialog box:
      - **Retries** – The number of retries to perform before reporting a failure. The default setting is five retries.
      - **Timeout** – The number of seconds to wait before reporting that the operation timed out. The default setting is 5 minutes (300 s).
      - **Description** – A description of this transport that appears in the **Manage ConnectEMC** window. The default description is **Email Transport**.
      - **Email Subject** – The subject line in the email. The default subject line is **Avamar ConnectEMC Notification Email**.

Do not change the email subject unless instructed to do so by EMC Customer Support. EMC spam filters can reject email messages with other subject lines.

   e. Click **OK**.

5. (FTP only) After selecting **FTP**, complete the following steps.
   a. In the **IP Address** field, specify an IPv4 address.
   b. In the **Username** field, specify an FTP username. The setting depends on the FTP server software.
   c. In the **Password** field, specify the password for the username.
   d. (Optional) To configure advanced settings, click **Advanced**, and then specify the following settings in the **Edit Advanced FTP Settings** dialog box:
      - **Retries** – The number of retries to perform before reporting a failure. The default setting is five retries.
      - **Timeout** – The number of seconds to wait before reporting that the operation timed out. The default setting is 5 minutes (300 s).
      - **Description** – A description of this transport that appears in the **Manage ConnectEMC** window. The default description is **FTP Transport**.
FEP Folder – A unique customer UNIX path in the ConnectEMC Front End Processor (FEP). Use the folder location that is supplied by EMC Customer Support.

FTP Port – An IP port. The default setting is port 21.

Mode – Either Active or Passive. The default setting is Active.

Do not change the email subject unless instructed to do so by EMC Customer Support. EMC spam filters can reject email messages with other subject lines.

e. Click OK.

6. (HTTPS only) After selecting HTTPS, complete the following steps.

a. Type a valid URL for the EMC Secure Remote Support home page in the URL field. Valid URLs use the following format:

```
https://home_name[:port]/target_directory
```

where `home_name`, `port`, and `target_directory` are the home name, data port, and target directory, respectively.

Use the URL provided by EMC Customer Support.

b. (Optional) To configure advanced settings, click Advanced, and then specify the following settings in the Edit Advanced HTTPS Settings dialog box:

- **Retries** – The number of retries to perform before reporting a failure. The default setting is five retries.
- **Timeout** – The number of seconds to wait before reporting that the operation timed out. The default setting is 5 minutes (300 s).
- **Private Key Pass Phrase** – The passphrase that is associated with the private key file.
- **Private Key File** – The file name of the private key file.
- **Client Certificate** – The client certificate to use. The default setting is “Default,” which uses the certificate that the MCS uses. Otherwise, type the file name of the client certificate.
- **Server CA Bundle** – File containing a list of root certificates.
- **Verify Server Name** – Whether to verify the server name. Either Yes or No. The default setting is No.

c. Click OK.

Sample key files are provided in /opt/connectemc/certs/ and https-privatekey.pem. Sample client certificates are provided in /opt/connectemc/certs/ and https-cert.pem. Sample root certificate bundles are provided in /opt/connectemc/certs/ and https-ca-cert.pem.

7. Click OK on the Edit Primary/Secondary Transport dialog box.

**Editing the notification transport**

**Procedure**

1. In Avamar Administrator, select Tools > Manage ConnectEMC.

   The Manage ConnectEMC window appears.

2. Select Notification Transport and click Edit.
The Edit Notification Transport dialog box appears.

3. From the Notification Type list, select one of the following types:
   - **On Success** — Notify recipients when an event file is successfully transferred to EMC.
   - **On Failure** — Notify recipients when an event file is not successfully transferred to EMC.
   - **On Success or Failure** — Notify recipients when an attempt is made to transfer an event file to EMC, regardless of the outcome.
   - **On All Failure** — Notify recipients when all attempts to transfer an event file to EMC have failed.

4. In the SMTP Host (Email Server) box, type the mail server hostname or IPv4 address.

5. In the Email Address box, type one or more recipients of these emails. Separate multiple email addresses with commas.

6. In the Email Sender Address box, type the email address from which the notification is sent.

7. (Optional) To specify advanced settings, click Advanced and then specify the settings in the Edit Advanced Email Settings dialog box:
   a. In the Retries box, specify the number of retries to attempt before reporting a failure. The default setting is 5 retries.
   b. In the Timeout box, specify the number of seconds to wait before reporting that the operation timed out. The default setting is 300 seconds (5 minutes).
   c. In the Description box, specify the description of this transport that appears in the Manage ConnectEMC window. The default description is Email Transport.
   d. In the Email Subject box, specify the subject line for the email. The default subject line is Avamar ConnectEMC Notification Email.

   **NOTICE**
   Do not change the email subject unless instructed to do so by EMC Customer Support. Email messages with other subject lines might be rejected by EMC spam filters.

   e. From the Email Format list, select the format of the email, either ASCII or HTML. The default setting is ASCII.
   f. Choose whether to include attachments sent to ConnectEMC in the notification email message by selecting or clearing the Include CallHome Data checkbox.
   g. Click OK.

8. On the Edit Notification Transport dialog box, click OK.

Testing transports

Procedure

1. In Avamar Administrator, select Tools > Manage ConnectEMC.
   The Manage ConnectEMC window appears.

2. Click Test.
Verifying system integrity

To verify Avamar server integrity, you must first ensure that a validated server checkpoint exists.

You might also want to collect and examine the server log files to ensure that no errors have occurred since that checkpoint was performed. Viewing Avamar server log files on page 207 provides instructions.

Procedure

1. In Avamar Administrator, click the Server launcher button.
   
   The Server window appears.

2. Click the Server Management tab.

3. Select the Avamar server name in the left pane.

4. Verify that the Last validated checkpoint field shows a recent calendar date.
CHAPTER 9

Capacity Management

This chapter includes the following topics:

- Capacity utilization information ................................................................. 218
- Capacity limits and thresholds ................................................................. 218
- Capacity forecasting ................................................................................... 219
- Customizing capacity limits and behavior .................................................. 219
Capacity utilization information

View real-time capacity utilization information for a single server in Avamar Administrator or for multiple servers in Backup & Recovery Manager.

In Avamar Administrator, view capacity utilization information for a single Avamar server on the Capacity panel of the Avamar Administrator dashboard and on the Server Management tab in the Server window.

Capacity utilization information for multiple servers is available through Backup & Recovery Manager. For information about this capability, refer to the Backup & Recovery Manager product documentation.

Capacity limits and thresholds

This following table describes how an Avamar server behaves as it crosses various consumed storage thresholds.

Table 75 Capacity limits and thresholds

<table>
<thead>
<tr>
<th>Storage utilization</th>
<th>Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Less than 75%</td>
<td>☑️</td>
<td>The system is considered to have adequate capacity to store future backups.</td>
</tr>
<tr>
<td>75%</td>
<td>⚠️</td>
<td>Study server storage utilization to determine whether the server has adequate capacity to store future backups.</td>
</tr>
<tr>
<td>80%</td>
<td>⚠️</td>
<td>A pop-up notification warns you that the server has consumed 80% of its available storage capacity. Study server storage utilization to determine whether the server has adequate capacity to store future backups.</td>
</tr>
<tr>
<td>90%</td>
<td>☑️</td>
<td>Study server storage utilization to determine whether the server has adequate capacity to store future backups.</td>
</tr>
<tr>
<td>95%</td>
<td>☑️</td>
<td>The server has reached the default health check limit, which is the amount of storage capacity that can be used and still have a “healthy” server. Avamar completes all in-progress backups, but the dispatcher stops new backup activity. When you log in to Avamar Administrator, a notification appears. Acknowledge the system event to resume future backup activity. You can customize the health check limit, but setting the limit higher than 95% is not recommended. <a href="#">Customizing capacity limits and behavior on page 219</a> provides instructions.</td>
</tr>
<tr>
<td>100%</td>
<td>☑️</td>
<td>The server has reached the read-only limit and automatically becomes read-only to protect the integrity of the data that is already stored on the server. If ConnectEMC has been enabled, a Service Request (SR) is logged. Go to EMC Online Support to view existing SRs for the system. Search the knowledgebase for “Avamar User and OS Capacity Management solution esg118578”.</td>
</tr>
</tbody>
</table>
Capacity forecasting

Every Avamar server continuously tracks and analyzes the rate at which storage capacity is consumed, and projects how long storage capacity can be consumed at that rate. This forecasting occurs in the background.

Capacity forecasting results for an Avamar server and configured Data Domain systems are available in the Capacity panel of Avamar Administrator. For more information, see Capacity panel on page 41.

Customizing capacity limits and behavior

Edit the Avamar Administrator preferences file to customize the settings that control capacity limits and system behavior.

Editing capacity settings for Avamar Administrator

Procedure

1. Open a command shell and log in by using one of the following methods:
   - For a single-node server, log in to the server as admin.
   - For a multi-node server:
     a. Log in to the utility node as admin.
     b. Load the admin OpenSSH key by typing:

        ```
        ssh-agent bash
        ssh-add ~admin/.ssh/admin_key
        ```
     c. When prompted, type the admin_key passphrase and press Enter.

2. Shut down the Management Console Server (MCS) by typing the following command:

   ```
   dpnctl stop mcs
   ```

3. Change directory by typing the following command:

   ```
   cd /usr/local/avamar/var/mc/server_data/prefs
   ```

4. Open mcserver.xml in a text editor.

5. Find the com.avamar.mc.mcsm section of the preferences file.

6. Edit the following settings.

   Table 76 Capacity settings in mcserver.xml

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>
<td>capErrPercent</td>
<td>When capacity usage reaches this percentage, the capacity state icon is red.</td>
<td>95%</td>
</tr>
<tr>
<td>capForecastDataDays</td>
<td>Amount of historical capacity usage data that is used for forecasting.</td>
<td>30 days</td>
</tr>
<tr>
<td>capForecastDataMinDays</td>
<td>Minimum amount of historical capacity usage data that is required for forecasting.</td>
<td>14 days</td>
</tr>
</tbody>
</table>

7. Save the changes and close the file.
8. Start the MCS and the scheduler by typing:

   ```
   dpnctl start mcs
   dpnctl start sched
   ```
CHAPTER 10

Replication

This chapter includes the following topics:

- Overview of Avamar replication ................................................................. 222
- Enabling Replicas at Source ..................................................................... 227
- Configuring policy-based replication ......................................................... 229
- Configuring cron-based replication .......................................................... 236
- Performing on-demand replication ............................................................ 238
- Performing command line replication ....................................................... 239
- Monitoring replication .............................................................................. 250
- Canceling a replication task ....................................................................... 250
- Restoring by using a replica on a destination system ............................... 251
- MCS configuration parameters to support Replicas at Source ............... 252
Overview of Avamar replication

The Avamar replication process copies client backups from a source Avamar system to a destination system.

Replication prevents data loss if the source Avamar system fails because copies of the backups (replicas) are stored on the destination system.

Types of replication

Avamar provides policy-based replication and command line replication. Avamar continues to support cron-based replication.

Policy-based replication

Policy-based replication provides greater control of the replication process. With policy-based replication, create replication groups in Avamar Administrator that define the following replication settings:

- Replication group members, either domains or clients
- Priority order for replication tasks
- Backups to replicate, based on the retention setting or the backup date
- Maximum number of backups to replicate for each client
- Destination system for the replicas
- Replication schedule
- Retention of replicas

Command line replication

Perform on-demand replication from the command line by logging in to the utility node and using the `avrepl` command line interface (CLI). Command line replication provides greater control of the replication process. Options for the `avrepl` command define the following replication settings:

- Domains or clients to replicate
- Backups to replicate, based on:
  - Plug-in that is used for the backup
  - Retention setting for the backup
  - Backup date
- Maximum number of backups to replicate for each client
- Destination system for the replicas
- Retention of replicas

Cron-based replication

For Avamar systems, cron-based replication is a legacy method of replication and is deprecated. As of Avamar server version 7.0, policy-based replication is the default on all new Avamar servers. Avamar servers that use cron-based replication can continue to use that mechanism concurrent with, or instead of, policy-based replication.

The cron-based replication mechanism replicates the backup data of all clients on the Avamar system. Cron-based replication can be configured to limit replication to backups with a certain retention type. Cron-based replication runs daily at the time that is specified in the replication configuration.
Replication scheduling

The method for scheduling replication tasks depends on the type of replication that is used. For policy-based replication, define schedules similar to how backup schedules are defined. For cron-based replication, define a daily start time and a maximum duration for replication tasks. For command line replication, no schedule is defined because a replication task is manually started by running the `avrepl` command on the utility node.

**Defining a schedule for policy-based replication**
To configure schedules for policy-based replication, select Tools > Manage Schedules to open the Manage All Schedules window. From this window, define a schedule to start replication tasks automatically on a daily, weekly, or monthly interval. You can also create an on-demand schedule that does not run automatically.

The schedule includes a start time and end time to specify the replication window.

**Defining a schedule for cron-based replication**
To configure a cron-based replication schedule define the daily start time and an optional timeout value. The timeout value controls the maximum number of seconds that the replication task can run. The default cron-based timeout setting is 72,000 seconds, or 20 hours.

Consider initially configuring a longer timeout value to prevent the replication task from stopping before all backups are replicated. Stopping before all backups are replicated can occur because the cron-based replication task replicates backups alphabetically by client name, and earliest backups before later backups. Regularly examine the recent replicas on the destination system to ensure that all backups are replicating. It may be necessary to increase the optional timeout value during the first few weeks of replication.

The timeout value can be decreased over time. As more data replicates to the destination system, data deduplication increases and transfer times decrease.

Do not perform normal source server background maintenance tasks such as checkpoint validation and garbage collection while replication is in progress.

**Time zone considerations**
When using Avamar Administrator to schedule replication tasks be aware that the start time appears in the time zone of the computer that is running Avamar Administrator. The start time does not appear in the time zone of the source system or in the time zone of the destination system.

For example, consider using Avamar Administrator in the Pacific time zone with a source system in the Eastern time zone. The source system compensates for the three-hour difference between the two time zones. An 8 p.m. PT start time that is specified in Avamar Administrator means that the source system starts the replication task at 11 p.m ET.

**Best practices for replication scheduling**
Schedule replication tasks during periods of low backup activity to ensure that the greatest number of client backups successfully replicate during each replication session. This scheduling consideration accommodates the fact that only completed client backups are replicated.

For policy-based replication, consider the size of each replication group so that all backups replicate successfully during each scheduled replication task. When a group grows so large that backups are not all replicating successfully, edit the schedule to enable more time, or split the group into smaller groups that run separately.
Replication authentication

Specify valid credentials for an account on the destination system when you configure policy-based replication or cron-based replication. For command line replication, specify valid credentials for the source Avamar system and for the destination system at the command prompt.

For policy-based replication, specify the credentials when adding a destination system on the Destinations tab in the Replication window.

For cron-based replication, specify the credentials in the Destination User ID and Destination User Password boxes in the Replication cron job dialog box in Avamar Administrator.

For command line replication, specify the user account and password for the destination system by using the --[replscript]dstid and --dstpassword options. Use the --[avtar]id and --password options to specify the user account and password for the source system.

On the source Avamar system, the repluser account is the default account for replication. When you use the repluser account for command line replication, omit the --[avtar]id option from the command and specify the password for the repluser account with the --password option. The EMC Avamar Product Security Guide provides a complete list of default accounts and passwords on the Avamar system.

Location of replicas on a destination Avamar system

On a destination Avamar system, replicas are available in the REPLICATE domain. This domain contains a duplicate representation of the client hierarchy that exists on the source Avamar system.

In the following figure, the avamar-1.example.com destination Avamar system contains both local clients and replicas from the avamar-2.example.com source server.

![Replication domain structure example](image)

All data in the REPLICATE domain is read-only. You can perform only the following operations on replicas in the REPLICATE domain:

- Change the expiration date of the replica
- View backup statistics
- Delete a replica
Replicas at Source on page 225 describes the Replicas at Source feature that provides management of replicas through the replication source Avamar server instead of the REPLICATE domain on the destination system.

Replicas at Source

With Replicas at Source, view and manage replicas by using an Avamar Administrator session on the Avamar server that is the replication source.

Features
The Replicas at Source feature is in Avamar server version 7.2 and newer. Enabling Replicas at Source on page 227 describes how to enable the feature.

The following table describes the features that Replicas at Source provides on the source Avamar server.

Table 77 Replicas at Source features available through the source Avamar server

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>View replicas on Restore tab</td>
<td>Replicas appear along with backups on the Restore tab of the Backup, Restore and Manage window in Avamar Administrator.</td>
</tr>
<tr>
<td>Manage replica settings</td>
<td>Use Avamar Administrator or the CLI to perform the following actions with a replica:</td>
</tr>
<tr>
<td></td>
<td>• Change expiration date</td>
</tr>
<tr>
<td></td>
<td>• Change retention</td>
</tr>
<tr>
<td></td>
<td>• Delete</td>
</tr>
<tr>
<td></td>
<td>• Validate</td>
</tr>
<tr>
<td></td>
<td>• View statistics</td>
</tr>
<tr>
<td>Restore from replica</td>
<td>Using the same methods that are available for backups, select a replica and restore it.</td>
</tr>
<tr>
<td>Periodic synchronization</td>
<td>Periodically, the source Avamar system synchronizes with each active destination system. This synchronization includes the following actions:</td>
</tr>
<tr>
<td></td>
<td>• Apply expiration setting changes</td>
</tr>
<tr>
<td></td>
<td>• Apply retention setting changes</td>
</tr>
<tr>
<td></td>
<td>• Delete local listing if replica does not exist on remote destination</td>
</tr>
<tr>
<td></td>
<td>• Add local listing when unlisted replica is found on remote destination</td>
</tr>
</tbody>
</table>

Note
Replicas at Source does not support replicas of virtual machine backups.

Integration
Several Avamar tasks integrate Replicas at Source. The sections that document these tasks include information about the integration of Replicas at Source features. The following table provides an overview of the Replicas at Source integration.
Table 78 Descriptions of the integration of Replicas at Source into Avamar tasks

<table>
<thead>
<tr>
<th>Task</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Remote destination management</td>
<td>Prevents deletion of a remote destination listing from the source Avamar server when replicas from the source Avamar server exist on the destination system. Includes an override option to force the deletion of the remote destination listing and delete all the source server’s replicas from the destination system.</td>
</tr>
<tr>
<td>Restore</td>
<td>Lists replicas with backups on the Restore tab of the Backup, Restore and Manage window in Avamar Administrator. When a backup exists on the source Avamar system and replicas exist on remote destination systems, the Avamar system uses the backup to restore.</td>
</tr>
<tr>
<td>Retire client</td>
<td>When retiring a client, Replicas at Source provides additional choices that are related to the retention and expiration of replicas.</td>
</tr>
<tr>
<td>Delete client</td>
<td>When deleting a client, Replicas at Source provides an option to also delete the client’s replicas.</td>
</tr>
<tr>
<td>Services administration</td>
<td>Adds the External Backup Manager Service to the Services Administration tab of the Administration window in Avamar Administrator. The service includes standard service actions: Start, Stop, Restart, and View Properties. When the External Backup Manager Service is stopped, Avamar Administrator prevents Replicas at Source management of replicas.</td>
</tr>
<tr>
<td>MCS</td>
<td>Replicas at Source adds customizable settings to mcserver.xml.</td>
</tr>
<tr>
<td>MCCLI</td>
<td>Replicas at Source adds hostname and location information to the output of mccli backup show. Replicas at Source also provides the --location option for identifying replicas when running any of the following commands:</td>
</tr>
<tr>
<td></td>
<td>• mccli backup validate</td>
</tr>
<tr>
<td></td>
<td>• mccli backup delete</td>
</tr>
<tr>
<td></td>
<td>• mccli backup edit</td>
</tr>
<tr>
<td></td>
<td>• mccli backup restore</td>
</tr>
</tbody>
</table>

Retention of replicas

When you replicate backups, the retention setting for the backup on the source Avamar system automatically applies to the replica on the destination system. However, you can change the retention setting for the replica.

**Set retention before replication occurs**
For policy-based replication, specify a different retention setting for replicas on the Expiration page when you configure the replication group.

For command line replication, use the --[avtar]expires option to specify a different retention setting for replicas.

However, for backups that are replicated through cron-based replication, manually changing the expiration date after replication is the only way to edit retention.

**Set retention after replication occurs**
Enable Replicas at Source to use an Avamar Administrator session on the source Avamar server to set the retention of replicas on the destination system.
Replication with Data Domain systems

When an Avamar system stores backups on a Data Domain system, Avamar replication uses DD Boost to copy backups from the original Data Domain system and to create replicas on another Data Domain system.

Supported replication configurations
The following table lists the supported replication configurations for Avamar replication using DD Boost.

<table>
<thead>
<tr>
<th>Backup storage</th>
<th>Replication storage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Single Data Domain system</td>
<td>Single Data Domain system</td>
</tr>
<tr>
<td>Single Data Domain system</td>
<td>Multiple Data Domain systems</td>
</tr>
<tr>
<td>Multiple Data Domain systems</td>
<td>Single Data Domain system</td>
</tr>
<tr>
<td>Multiple Data Domain systems</td>
<td>Multiple Data Domain systems</td>
</tr>
</tbody>
</table>

In a configuration where the replication storage consists of multiple Data Domain systems, control which system receives the replicas by mapping a domain on the source Avamar server to a destination Data Domain system. Also specify which Data Domain system is the default destination. Avamar replicates to the default destination when a destination Data Domain system is not identified on the Storage Mapping tab of the Replication window in Avamar Administrator.

The *EMC Avamar and EMC Data Domain System Integration Guide* provides instructions on storage mapping and specifying the default destination Data Domain system.

Replication details
The following details apply to Avamar replication with Data Domain systems:

- Data transfer during replication is between the Data Domain systems, without intermediate staging
- Replication uses DD Boost to copy backups and to write replicas
- Requires a Data Domain replication license
- Does not use Data Domain replication
- Replication is configured and monitored on the Avamar server
- Replication task scheduling uses Avamar replication schedules only
- Data Domain administration tools are not used

Enabling Replicas at Source

The Replicas at Source feature is in Avamar server versions 7.2 and newer. To enable the feature, modify `mcserver.xml` and then start the Remote Backup Manager Service.

Before you begin
Install or upgrade the Avamar server software to version 7.2 or newer.
Procedure
1. Open a command shell and log in by using one of the following methods:
   - For a single-node server, log in to the server as admin.
   - For a multi-node server:
     a. Log in to the utility node as admin.
     b. Load the admin OpenSSH key by typing:
        
        ```
        ssh-agent bash
        ssh-add ~admin/.ssh/admin_key
        ```
     c. When prompted, type the admin_key passphrase and press Enter.
2. Stop the MCS by typing the following command:
   ```
   dpnctl stop mcs
   ```
3. Change the working directory by typing the following command:
   ```
   cd /usr/local/avamar/var/mc/server_data/prefs
   ```
4. Open mcserver.xml in a text editor.
5. In the repl container element, set the value of the allow_dest_replica_management parameter to true.
   The default value is false.
6. In the repl container element, set the value of the show_external_backups parameter to true.
   The default value is true.
7. In the repl container element, set the value of the allow_manage_remote_backups_at_source parameter to true.
   The default value is true.
8. Save the change and close the file.
9. Start the MCS and the scheduler by typing:
   ```
   dpnctl start mcs
   dpnctl start sched
   ```
10. Log in to Avamar Administrator on the Avamar server that is associated with the client backups (source server).
11. In Avamar Administrator, click the Administration launcher button.
    The Administration window appears.
12. Click the Services Administration tab.
13. Right-click the Remote Backup Manager Service, and select Start.

Results
The Avamar server enables the Replicas at Source feature.
Configuring policy-based replication

Preparing to use policy-based requires the completion of several distinct tasks.

Before you begin

Log in to Avamar Administrator on the Avamar server that is associated with the client backups (source server).

The following steps provide an overview of the order of the tasks for configuring policy-based replication. Each step is explained in more detail in a separate task section.

Procedure

1. Using Avamar Administrator, add a replication destination for each system that stores replicas from the source server (destination system).
   
   Replication destinations on page 229 provides information about replication destinations, including how to add a destination system.

2. Using Avamar Administrator, create daily, weekly, or monthly schedules to use for replication scheduling.

   In Avamar, creating a replication schedule is the same as creating a backup schedule. Schedules on page 95 describes Avamar schedules and how they are created.

3. Using Avamar Administrator, create one or more replication groups to define the settings for the policy-based replication.

   Replication groups on page 231 provides information about replication groups, including how to create a replication group.

Replication destinations

Add replication destinations to begin configuring policy-based replication on an Avamar server.

Provide connection details for a supported data storage system to add it as a replication destination.

Avamar supports replication to other Avamar systems and to Data Domain systems through DD Boost. An Avamar system can replicate to another Avamar system that is running a different version of the Avamar server software, but best results occur with the same server software version.

Adding an Avamar system as a replication destination

Provide connection information for an Avamar system to add it as a replication destination.

Procedure

1. In Avamar Administrator, click the Replication launcher button.

   The Replication window appears.

2. Select the Destinations tab.

3. Select Actions > New Destination.

   The New Replication Destination dialog box appears.

4. In Name, type a reference name for the destination Avamar system.

5. In Destination server type, select Replicate.
6. In **Encryption**, select an encryption level.
   The selected encryption level applies to replication data transfers with the destination Avamar system.

7. In **Target server address**, type the DNS name or the IP address of the destination Avamar system.

8. In **Target server connection port**, type the number of the outbound port on the source Avamar system to use when communicating with the destination Avamar system.
   The default port value is 27000.
   Selecting **High** or **Medium** in **Encryption** results in an offset being applied to port to allow connections through firewalls. The default offset is +2000. Edit the offset by manually editing the ```secured_port_offset``` preference in ```mcserver.xml``` and then restarting the MCS.

9. In **Target MCS connection port**, type the number of the inbound port on the destination Avamar server to use for data connections with MCS on the destination system.
   The default port value is 28001.

10. In **User ID on target server**, type a username for an account on the destination Avamar system that has the **backup** privilege and the **admin** privilege.
    Normally, type `repluser` or `root`.

    **Note**
    For a user with access limited to a domain beneath the root domain (tenant access), both the source Avamar server and the destination system must be running Avamar server version 7.2 or newer.

11. In **Password on target server**, type the password that is associated with the username.

12. Click **Verify Authentication**.
    The source Avamar system authenticates with the destination Avamar system by using the specified settings.
    In the **Verifying Authentication** dialog box, a results message appears.

13. In the **Verifying Authentication** dialog box, click **Close**.

14. In the **New Replication Destination** dialog box, click **OK**.

**Results**
Avamar Administrator adds the replication destination to the list on the **Destinations** tab.

**Editing a replication destination**
Change the connection information for a replication destination.

**Procedure**
1. In Avamar Administrator, click the **Replication** launcher button.
   The **Replication** window appears.
2. Click the **Destinations** tab.
3. Select the replication destination to edit.
4. Select Actions > Edit Destination. The Replication Destination dialog box appears.

5. Edit the settings for the replication destination.

6. Click OK.

Results
Avamar Administrator modifies the settings of the selected replication destination.

Deleting a replication destination record
Delete the record for a replication destination from a source Avamar system.

When Replicas at Source is enabled, the Avamar system checks for replicas on the replication destination system. If replicas associated with the source Avamar system exist, Avamar Administrator prevents the deletion of the replication destination record. Override this setting to delete the replication destination record even when replicas exist.

When Replicas at Source is disabled, the Avamar system does not check for replicas on the replication destination system before deleting the replication destination record. Any existing replicas remain on the replication destination system until they expire or until they are deleted by using the destination system interface.

Procedure
1. In Avamar Administrator, click the Replication launcher button. The Replication window appears.

2. Click the Destinations tab.

3. Select the replication destination record to delete.

4. Select Actions > Delete Destination. A confirmation message appears.

5. Click Yes.

<table>
<thead>
<tr>
<th>Replicas at Source</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enabled</td>
<td>The Avamar system checks for replicas on the replication destination system and if no replicas exist, deletes the replication destination record. To prevent the Avamar system from checking for replicas, and delete the replication destination record even if replicas exist on the replication destination system, clear Check for remote backups before deletion, then click Yes.</td>
</tr>
<tr>
<td>Disabled</td>
<td>The Avamar system deletes the replication destination record.</td>
</tr>
</tbody>
</table>

Replication groups
Replication groups enable you to define the settings for policy-based replication, including the domain and client members of the replication group, the backup types to replicate, the number of backups to replicate, the destination server, the replication schedule, and how long replicated backups are retained on the destination server.

You also specify the priority for which backup data replicates first. When you define the members of the replication group, the order in which members are listed in the Member(s) list controls the order in which backup data is replicated.
Backup data for a client replicates only once, even if a client is listed individually and is also a member of a domain in the Member(s) list.

In addition, if an individual client is a higher priority in the Member(s) list than the domain to which it belongs, then the backup data for the individual client replicates before the backup data for any other clients in the domain.

Creating a replication group

**Before you begin**

- Add a destination Avamar server to the configuration on the source Avamar server.
- (Optional) Create a schedule for when replication for the group should occur. Creating a schedule on page 97 provides instructions.

**Procedure**

1. In Avamar Administrator, click the Replication launcher button.
   
   The Replication window appears.

2. Select the Groups tab.

   
   The New Replication Group wizard opens, starting with the General page.

4. Type a name for the replication group in the Replication group name box.

5. Choose whether to enable or disable replication for the replication group:
   - Select the Disabled checkbox to disable replication for the replication group.
   - Leave the checkbox clear to enable replication for the replication group.

6. From the Encryption method list, select the encryption setting for data transfers between the source and destination servers.

   The encryption technology and bit strength that is used for a connection depends on several factors, including the server platform and Avamar server version. The EMC Avamar Product Security Guide provides details.

7. Click Next.
   
   The Source page appears.

8. Complete the steps that are required for the members in the replication group.

<table>
<thead>
<tr>
<th>Members in the replication group</th>

</tbody>
</table>
| Specific domains or clients      | a. Select Choose specific client(s) and/or domain(s) to replicate.  
|                                  | b. Click Choose Membership.  
|                                  | The Replication Group Membership dialog box appears.  
|                                  | c. Select the checkboxes next to the domains or clients to add to the replication group.  
|                                  | Selected members appear in the Member(s) list.  
|                                  | d. Set replication priority for the replication group members by controlling the order in which domains and clients appear in |
Members in the replication group | Steps
---|---
the Member(s) list. Select members in the list and use the arrow buttons to change the order of the list.
e. To remove a member from the replication group, select the member in the Member(s) list and click X.
f. Click Finish.

9. Complete the steps that are required for the type of backups to replicate.

<table>
<thead>
<tr>
<th>Type of backups to replicate</th>
<th>Steps</th>
</tr>
</thead>
<tbody>
<tr>
<td>All backups from all members of the replication group</td>
<td>Select Replicate all backups.</td>
</tr>
</tbody>
</table>

Specific backups | Steps
---|---
a. Select Include/exclude backups by type, date, and more.
b. Click Change Filter.
The Replication Filter Options dialog box appears.
c. Select the type of backups to replicate: Daily, Weekly, Monthly, Yearly, or Not tagged.
Select at least one backup type.
d. Specify the maximum number of backups to replicate for each client that is a member of the replication group.
To replicate all backups (no maximum), select No limit.
To replicate a certain number of the most recent backups for each member client, select backup(s) and then specify the maximum number in the list.
e. Specify date restrictions for the backups to replicate for each client that is a member of the replication group.
To replicate all backups regardless of when the backups occurred, select No Date Restrictions.
To replicate only backups that occurred within a recent period, select Last and then specify an amount of past Day(s), Weeks(s), Month(s), or Year(s) to include.
To replicate only backups that occurred during a range of dates, select Range and specify the start date/time in the From fields, or the end date/time in the To fields, or both.
f. Click OK.

10. Click Next.

The Destination page appears.

11. Select the destination server from the Where would you like to replicate backups to? list.
You can also add a destination server by selecting **New Destination** from the list, or edit the settings for a destination server by selecting the server from the list and then clicking **Modify**.

12. Click **Next**.

   The **Expiration** page appears.

13. Specify when the replicated backups should expire on the destination server:
   - To expire the replicated backups at the current expiration setting, select **Keep current backup expiration**.
   - To expire the replicated backups at a different time than the current expiration setting, select **Set expiration by backup type** and then specify the number of days, weeks, months, or years to retain each backup type.

   If a backup is of multiple types, then the expiration for the replicated backup is set to the specified value for the longest duration backup type. For example, if a backup is both a daily and a monthly backup, then the expiration for the replicated backup is set to the value that you specify for monthly backups.

14. Click **Next**.

   The **Schedule** page appears.

15. Select the replication schedule from the **How often would you like this replication to run?** list.

   You can also create a schedule by selecting **New Schedule** from the list, or edit the settings for a schedule by selecting the schedule from the list and then clicking **Modify**.

16. Click **Next**.

   The **Overview** page appears.

17. Review the settings for the replication group.

18. (Optional) Specify plug-in options for the replication group:
   a. Click **More Options**.
   b. To replicate only backups from specific plug-ins, specify the numeric plug-in descriptor in the **Include plug-in specific backups** box.

   Separate multiple entries with a comma, or leave the box empty to replicate all backups. **Numeric plug-in descriptors on page 246** provides a list of numeric plug-in descriptors.

   c. To exclude backups from specific plug-ins from replication, specify the numeric plug-in descriptor in the **Exclude plug-in specific backups** box.

   Separate multiple entries with a comma, or leave the box empty to replicate all backups.

   d. From the **Informational message level** list, select the verbosity for informational messages in the replication log files:
      - Select **No informationals** to suppress all informational messages but include errors and warnings in the log files.
      - Select **Some informationals** to provide some information messages in the log files with errors and warnings.
      - Select **Many informationals** to provide additional status information in the log files with errors and warnings.
• Select All Informationals to provide maximum information in the log files, including all informational messages, errors, and warnings.

e. Specify whether to include advanced timing and deduplication statistics in the replication log files by selecting or clearing the Report advanced statistics checkbox.

f. From the Maximum concurrent processes list, select the maximum number of clients to replicate simultaneously.

g. Select the Show Advanced Options checkbox to specify advanced options.

h. To replicate only a specific backup, specify the backup sequence number in the Backup sequence number box or the backup label in the Backup label box. Specify the complete backup sequence number or label.

i. To replicate backups that have a label that matches a specific pattern, specify the pattern in the Backup label pattern box.

j. From the List contents being replicated list, specify how much information about the replicated backups to include in the replication log files:

• No file listing
• List file names
• List files and dates

Use caution when including file information in the replication log files. Replication performance decreases, and the size of the log files can be very large.

k. To write the maximum amount of information to log files for troubleshooting, select the Enable debugging messages checkbox.

l. To reduce network usage to a specified rate in megabits per second, specify the number of megabits in the Network usage throttle box.

Specify 0 (zero) for unrestricted network usage. Specify 0.772 to use 50 percent of a T1.

m. Click OK.

19. Click Finish.

Enabling and disabling a replication group

You can disable a replication group to prevent scheduled replications from occurring for that group. This is typically done to place the system in a state that supports maintenance activities. If you disable a replication group, you must re-enable the group to resume scheduled replications.

Procedure

1. In Avamar Administrator, click the Replication launcher button.

   The Replication window appears.

2. Select the Groups tab.

3. Select the replication group.

4. Select Actions > Disable Replication Group.
If the group is enabled, then a check mark appears next to **Disable Replication Group** to indicate that the group has been disabled. If the group is disabled, then the check mark clears to indicate that the group has been disabled.

5. Click **Yes** on the confirmation message.

### Editing a replication group

**Procedure**

1. In Avamar Administrator, click the **Replication** launcher button.
   
   The **Replication** window appears.
2. Select the **Groups** tab.
3. Select the replication group to edit.
4. Select **Actions** > **Edit Replication Group**.
   
   The **Edit Replication Group** wizard appears.
5. Edit the settings for the replication group.
   
   The settings are the same settings that you specified when you created the group.
6. Click **OK**.

### Deleting a replication group

When you delete a replication group from the configuration on the source Avamar server, any data that you already replicated to the destination server for the group remains on the destination server until the replicated backups expire or you delete the backups.

**Procedure**

1. In Avamar Administrator, click the **Replication** launcher button.
   
   The **Replication** window appears.
2. Select the **Groups** tab.
3. Select the replication group to delete.
4. Select **Actions** > **Delete Replication Group**.
   
   A confirmation message appears.
5. Click **Yes**.

### Configuring cron-based replication

You can configure cron-based replication for a single server in Avamar Administrator.

Cron-based replication was deprecated starting in Avamar 7.0 in favor of policy-based replication. Policy-based replication provides more granular control of the replication process. Avamar servers that were using cron-based replication before Avamar 7.0 can continue to use that replication method concurrently with or instead of policy-based replication.

#### Configuring cron-based replication with Avamar Administrator

**Procedure**

1. In Avamar Administrator, click the **Administration** launcher button.
   
   The **Administration** window appears.
2. Click the Services Administration tab.
3. Double-click the Replication cron job entry in the properties table.
   The Replication cron job dialog box appears. The following read-only fields appear on the Replication cron job dialog box.

   **Table 80 Read-only fields on the Replication cron job dialog box**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status</td>
<td>Current replication status. One of the following values:</td>
</tr>
<tr>
<td></td>
<td>• Running — Scheduled replication operations are occurring normally.</td>
</tr>
<tr>
<td></td>
<td>• Not Running — Scheduled replication operations are not occurring normally.</td>
</tr>
<tr>
<td></td>
<td>• Not Running, Suspended — Scheduled replication operations are not</td>
</tr>
<tr>
<td></td>
<td>occurring normally, and replication operations cannot occur until</td>
</tr>
<tr>
<td></td>
<td>replication resumes on this Avamar server.</td>
</tr>
<tr>
<td></td>
<td>• Running, Suspended — Replication operations were suspended while a</td>
</tr>
<tr>
<td></td>
<td>replication job was running. When operations are resumed, the</td>
</tr>
<tr>
<td></td>
<td>replication job resumes from where it left off.</td>
</tr>
<tr>
<td>Suspended</td>
<td>Indicates whether scheduled replication operations have been started (No)</td>
</tr>
<tr>
<td></td>
<td>or stopped (Yes).</td>
</tr>
<tr>
<td>Configuration File</td>
<td>Location of the repl_cron.cfg configuration file, which stores replication</td>
</tr>
<tr>
<td></td>
<td>settings for this Avamar system.</td>
</tr>
<tr>
<td>Configured</td>
<td>Indicates whether scheduled replication is configured on this source</td>
</tr>
<tr>
<td></td>
<td>Avamar server.</td>
</tr>
<tr>
<td>Last started</td>
<td>Start time of the last replication operation.</td>
</tr>
<tr>
<td>Last completed</td>
<td>Elapsed time since last replication operation completed.</td>
</tr>
<tr>
<td>Last Status</td>
<td>Status of the last completed replication operation. One of the following</td>
</tr>
<tr>
<td></td>
<td>values:</td>
</tr>
<tr>
<td></td>
<td>• None — Status for last replication operation is not available.</td>
</tr>
<tr>
<td></td>
<td>• Success — Last replication operation successfully completed.</td>
</tr>
<tr>
<td></td>
<td>• Failed — One or more errors were encountered during the last</td>
</tr>
<tr>
<td></td>
<td>replication operation.</td>
</tr>
</tbody>
</table>

4. In the Destination box, specify the DNS name of the destination Avamar server.
   Replication between servers of different versions is supported. However, for best results, ensure that the Avamar server software on the destination server is the same version or a newer version than the source Avamar server.

5. In the Destination Directory: /REPLICATE/ box, specify the destination directory on the destination Avamar server for the replicated data.
   The default location is /REPLICATE/source, where source is the hostname of the source Avamar server. You can edit the destination directory. However, the destination must always exist under the /REPLICATE domain.

6. In the Destination User ID box, specify the Avamar administrative user account ID (repluser) that is used to log in to the destination Avamar server.
7. In the Destination User Password box, specify the password for the Avamar administrative user account ID (repluser).

**NOTICE**

If you change the password for the replonly account on the target server, then remember to update the Destination User Password value in the replication configuration on the source server.

8. In the Timeout (seconds) box, specify the maximum length of time that each replication operation should run.

9. In the Bandwidth (Mbps) box, specify the network utilization throttling setting that specifies the maximum average network utilization that is allowed in megabits per second (Mbps).

   If the replication operation exceeds this setting, it is “throttled back” by introducing delays until the average network utilization falls below the specified threshold.

10. In the Work directory box, specify the full path to the temporary folder or directory for replication log files.

11. To limit the replication operation to only backups that have been assigned a specific retention type, select the checkbox next to the retention type in the Include backups with the following retention section.

12. From the Schedule list, select the time of day at which to start replication, or select Don't Run to suspend replication temporarily.

13. If the Start button is available, and the Stop button is dimmed, click Start.

   Clicking Start starts the Replication Cron Job service.

14. If the Resume button is available, and the Suspend button is dimmed, click Resume.

   Clicking Resume changes the Replication Cron Job service state from suspended to running.

15. Click Apply.

### Performing on-demand replication

You can perform on-demand replication of a replication group when you use policy-based replication. An on-demand replication is a one-time replication of data for the replication group. You may want to perform an on-demand replication for the first replication of the replication group after you configure policy-based replication. You should also perform on-demand replication before system maintenance, software installations, or software upgrades.

You can initiate on-demand replication from either the Replication window or the Policy window.

### Performing on-demand replication from the Replication window

**Procedure**

1. In Avamar Administrator, click the Replication launcher button.

   The Replication window appears.

2. Select the Groups tab.
3. Select the replication group.
4. Select Actions > Replicate Now.
   An On-Demand Replication Request dialog box indicates that the replication request was submitted.
5. Click Close.

Performing on-demand replication from the Policy window

Procedure
1. In Avamar Administrator, click the Policy launcher button.
   The Policy window appears.
2. Click the Policy Management tab.
3. Click the Groups tab.
4. Select the replication group from the list.
   Replication groups appear with a value of Replication in the Type column for the group.
5. Click Run.
   A confirmation message appears.
6. Click Close.

Performing command line replication

The avrepl command line interface (CLI) enables you to replicate data from a source Avamar server to a destination Avamar server.

The avrepl binary is located in the \usr\local\avamar\bin directory on the server utility node. You must log in as admin or root and run the command from that location.

Command reference

The following topics provide a reference for the operations and options that the avrepl command supports.

Synopsis

```
avrepl --operation=replicate [options] [target]
```

Operations

The only supported operation for avrepl is --operation=replicate, which replicates data from the source Avamar server to a destination Avamar server.

Options

Use the avrepl command options to control replication behavior.

Account options

Account options for the avrepl command enable you to specify credentials to connect to the destination Avamar server for replication.

The following account options are available for the avrepl command.
## Table 81 Account options for the avrepl command

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>--account=location</code></td>
<td>Specifies a hierarchical location on the destination Avamar server. This option is relative to the current home location, unless you use a slash (/) as a prefix to the path designation, in which case an absolute path is assumed. The default account is <code>REPLICATE</code>.</td>
</tr>
<tr>
<td><code>--acnt=location</code></td>
<td></td>
</tr>
<tr>
<td><code>--path=location</code></td>
<td></td>
</tr>
<tr>
<td><code>--[replscript]dstaddr=destination_server</code></td>
<td>Specifies the DNS name or IP address of the destination Avamar server. Replication between servers of different versions is supported. However, for best results, ensure that the Avamar server software on the destination server is the same version or a newer version than the source Avamar server.</td>
</tr>
<tr>
<td><code>--[replscript]dstid=repluser</code></td>
<td>Specifies the Avamar user ID and domain to use for authentication on the destination Avamar server.</td>
</tr>
<tr>
<td><strong>Note</strong></td>
<td>The repluser account is the only user account that is known to work reliably on all destination servers.</td>
</tr>
<tr>
<td><code>--dstpassword=password</code></td>
<td>Specifies the password for repluser account on the destination Avamar server.</td>
</tr>
<tr>
<td><code>--dstap=password</code></td>
<td></td>
</tr>
<tr>
<td><code>--dstpswd=password</code></td>
<td></td>
</tr>
<tr>
<td><code>--[replscript]dstpath=domain</code></td>
<td>Specifies a location (domain) on the destination Avamar server to store replicated source data. The default value is the top-level directory (), which stores the replicated data in a new domain that is named for the source Avamar server. Use this option with the <code>--[replscript]srcpath</code> option. You cannot use this option with the <code>--[replscript]dpnname</code> option.</td>
</tr>
<tr>
<td><code>--[replscript]dstport=port</code></td>
<td>Specifies the data port to use when connecting to the destination Avamar server. The default value is 27000.</td>
</tr>
<tr>
<td><code>--hfsaddr=Avamar_server</code></td>
<td>Specifies the DNS name or IP address of the source Avamar server.</td>
</tr>
<tr>
<td><code>--server=Avamar_server</code></td>
<td></td>
</tr>
<tr>
<td><code>--[avtar]id=user@auth</code></td>
<td>Specifies the Avamar user ID and authentication system to use for authentication on the source Avamar server. The default value is repluser, which is the default replication user account on the Avamar server. To authenticate with the Avamar authentication system, specify <code>avamar</code> for <code>auth</code>. For example: <code>--[avtar]id=jdoe@avamar</code>.</td>
</tr>
<tr>
<td><code>--password=password</code></td>
<td>Specifies the password for the Avamar user ID to use for authentication on the source Avamar server.</td>
</tr>
<tr>
<td><code>--ap=password</code></td>
<td></td>
</tr>
<tr>
<td><code>--pswd=password</code></td>
<td></td>
</tr>
</tbody>
</table>
Logging options

Logging options for the `avrepl` command enable you to specify the path and file name for the `avrepl` log file, and to control how much information the plug-in writes to the log file.

The following logging options are available for the `avrepl` command.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>--[avtar]informationals=n</code></td>
<td>Sets the information level for status messages, where <code>n</code> is a single-digit integer value.</td>
</tr>
<tr>
<td>`--[avtar]noinformationals={true</td>
<td>false}`</td>
</tr>
<tr>
<td>`--[avtar]statistics={true</td>
<td>false}`</td>
</tr>
<tr>
<td><code>--log=file</code></td>
<td>Specifies the full path and file name of the <code>avrepl</code> plug-in log file.</td>
</tr>
<tr>
<td><code>--logfile=file</code></td>
<td></td>
</tr>
<tr>
<td>`--nostream={true</td>
<td>false}`</td>
</tr>
<tr>
<td>`--nowarnings={true</td>
<td>false}`</td>
</tr>
<tr>
<td>`--quiet={true</td>
<td>false}`</td>
</tr>
<tr>
<td><code>--verbose</code></td>
<td>Specify either <code>--verbose</code> or <code>--v</code> to enable all messages, including status and warning messages. Specify <code>--verbose=n</code> to control the level of verbosity. The default value is <code>--verbose=6</code>.</td>
</tr>
</tbody>
</table>

Replication options

Replication options for the `avrepl` command enable you to control replication functionality, such as which backups should replicate and how long to retain replicated backups on the destination server.

The following replication options are available for the `avrepl` command.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>--[avtar]after=timestamp</code></td>
<td>Specifies that only backups matching <code>timestamp</code> and later should be replicated. For <code>timestamp</code>, use 24 hour local time zone values that conform to the syntax <code>yyyy-mm-dd hh:mm:ss</code>. You can use partial <code>timestamp</code> values. The resolution is truncated to the last supplied value. For example, <code>2014-02</code> is equivalent to <code>2014-02-01 00:00:00</code>. You can also use this option with <code>--[avtar]before=timestamp</code> to define a range of effective dates. Only backups that occurred within the date range are replicated.</td>
</tr>
</tbody>
</table>
### Table 83 Replication options for the `avrepl` command (continued)

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>`--[avtar]allsnapups={true</td>
<td>false}`</td>
</tr>
<tr>
<td><code>--[avtar]before=timestamp</code></td>
<td>Specifies that only backups that occurred before <code>timestamp</code> should be replicated. For <code>timestamp</code>, use 24 hour local time zone values that conform to the syntax <code>yyyy-mm-dd hh:mm:ss</code>. You can use partial <code>timestamp</code> values. The resolution is truncated to the last supplied value. For example, <code>2014-02</code> is equivalent to <code>2012-02-01 00:00:00</code>. You can also use this option with <code>--[avtar]after=timestamp</code> to define a range of effective dates. Only backups that occurred within the date range are replicated.</td>
</tr>
<tr>
<td><code>--[avtar]count=n</code></td>
<td>Limits replicated backups to this maximum number (<code>n</code>) of most recent backups for each client.</td>
</tr>
<tr>
<td><code>--[avtar]exclude-pluginid-list=list</code></td>
<td>Excludes backups that are performed with the specified plug-in, where <code>list</code> is a comma-separated list of plug-in IDs.</td>
</tr>
</tbody>
</table>
| `--[avtar]expires={n | period | timestamp}` | Specifies how long to retain replicated backups on the destination server:  
- A number of days (`n`).  
- An expiration `period` as a specific number of days, weeks, months, or years. To specify a period, use one of the following values:  
  
  ```  
  days=n  
  weeks=n  
  months=n  
  years=n  
  ```  

  where `n` is a positive integer. For example, supply `--[avtar]expires=years=2` to retain replicated backups for two years on the destination server. Also, `--[avtar]expires=days=30` and `--[avtar]expires=years=2` are equivalent.  
- A `timestamp` for the date and time at which the replicated backup expires. Use 24 hour local time zone values that conform to the syntax `yyyy-mm-dd hh:mm:ss`. You can use partial `timestamp` values. The resolution is truncated to the last supplied value. For example, `2014-02` is equivalent to `2014-02-01 00:00:00`. |
| `--[avtar]pluginid-list=list`  | Replicates only backups that are performed with the specified plug-ins, where `list` is a comma-separated list of plug-in IDs.                                                                                                                              |
| `--[avtar]retention-type={daily | weekly | monthly | yearly | none}` | Replicates only backups with one of the following retention types:  
- daily  
- weekly  
- monthly  
- yearly  

---

**Replication**

EMC Avamar 7.2 Administration Guide

242
Table 83 Replication options for the `avrepl` command (continued)

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>- <strong>none</strong></td>
</tr>
<tr>
<td></td>
<td>If you supply <strong>none</strong>, then only backups without a specific retention type are replicated.</td>
</tr>
<tr>
<td>--replscript dpnname=<code>source_server</code></td>
<td>Specifies a name to use to represent the source Avamar server (<strong>source_server</strong>) as part of the path for the replicated files in the <code>REPLICATE</code> domain on the destination server. Specify the fully qualified domain name of the source server. You cannot use this option with the --replscript dstpath or --replscript srcpath options.</td>
</tr>
<tr>
<td>--replscript dstencrypt={ssl</td>
<td>tls}</td>
</tr>
<tr>
<td>--replscript srcpath=<code>domain</code></td>
<td>Specifies a location (<strong>domain</strong>) on the source Avamar server from which to begin replication. Only data within this location is replicated. The default setting is the top-level domain (<code>/</code>), which replicates the entire server. Use this option with the --replscript dstpath option. You cannot use this option with the --replscript dpnname option.</td>
</tr>
<tr>
<td>--backup-type=<code>type</code></td>
<td>Replicates only the specified type of backup, where <strong>type</strong> is one of the following values:</td>
</tr>
<tr>
<td></td>
<td>- <strong>differential</strong></td>
</tr>
<tr>
<td></td>
<td>- <strong>differential_full</strong></td>
</tr>
<tr>

<tr>
<td>--within={days</td>
<td>weeks</td>
</tr>
</tbody>
</table>

**Avamar-only options**

Avamar-only options access advanced functionality that is normally reserved for use by EMC personnel only. Misuse of these advanced options can cause loss of data. If you are unsure about any aspect of these options, contact EMC Customer Support for more information before using them.

The following Avamar-only options are available for the `avrepl` command.

Table 84 Avamar-only advanced options for the `avrepl` command

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>--bindir=<code>path</code></td>
<td>Specifies the directory that contains Avamar binary files. The default value is <code>/usr/local/avamar/bin</code>.</td>
</tr>
</tbody>
</table>
Table 84 Avamar-only advanced options for the avrepl command (continued)

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>`--[avtar]exp-delta={days</td>
<td>weeks</td>
</tr>
</tbody>
</table>
| `--[avtar]expiration-policy=type=period` | Replicates backups of a specific retention `type` within the specified `period`, where `type` is one of the following values:  
- dailies  
- weeklies  
- monthlies  
- yearlies  
and `period` is one of the following values:  
- days=n  
- weeks=n  
- months=n  
- years=n  
and n is a positive integer. For example, supply `--[avtar]expiration-policy=dailies=years=2` to replicate two years' worth of daily backups for each client. The `--[avtar]expiration-policy` option takes precedence over `--[avtar]expires`. |
| `--[avtar]label=name`  
`--f=name` | Specifies the labels of the backups to replicate. Separate multiple values with a comma. |
| `--[avtar]label-pattern=pattern` | Replicates backups with a label that matches the specified `pattern`. Common glob operators (wildcards) such as asterisk (*) and question mark (?) are allowed. Separate multiple patterns by commas, such as `--[avtar]label-pattern=temp,tmp`. You can also specify the `--[avtar]label-pattern` option multiple times in a single command. |
| `--[avtar]sequencenumber=n`  
`--[avtar]labelnumber=n` | Specifies the sequence number of the backup to replicate. Separate multiple entries with a comma. |
| `--[avtar]throttle=n` | Controls the rate at which the underlying `avtar` process sends data to the server. If you specify this option, `avtar` pauses after sending each packet to ensure that network usage does not exceed the specified maximum bandwidth in megabits per second (Mbps). For example, `--[avtar]throttle=5` uses half of a 10 Mbps connection, and `--[avtar]throttle=0.772` restricts usage to half of a T1 link. |
| `--[replscript]exclude=pattern` | Excludes domains or clients that contain `pattern` from replication, where `pattern` is a matching pattern in the domain or client name. Common glob operators (wildcards) such as asterisk (*) and question mark (?) are allowed. For example, specify `--[replscript]exclude=spot` to exclude any domain or client with a name that... |
Table 84 Avamar-only advanced options for the avrepl command (continued)

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Option</td>
<td>contains the pattern spot. Specify --[replscript]exclude=/clients/ to exclude all clients in the /clients domain. Separate multiple patterns by commas, such as --[replscript]exclude=spot,/clients/. You can also specify the --[replscript]exclude option multiple times in a single command to specify more than one pattern.</td>
</tr>
<tr>
<td>--[replscript]forcecreate={true</td>
<td>false}</td>
</tr>
<tr>
<td>--[replscript]force-move={1</td>
<td>0}</td>
</tr>
<tr>
<td>--[replscript]fullcopy={true</td>
<td>false}</td>
</tr>
<tr>
<td>--[replscript]globalcid={true</td>
<td>false}</td>
</tr>
<tr>
<td>--[replscript]reportonly={true</td>
<td>false}</td>
</tr>
<tr>
<td>--[replscript]restore={true</td>
<td>false}</td>
</tr>
<tr>
<td>--[replscript]small-client-mb=n</td>
<td>Threshold in MB before which the new data for a client is considered “small.” The default setting is 128 MB of new data. Specify 0 to disable this optimization.</td>
</tr>
<tr>
<td>--rechunk={disable</td>
<td>enable</td>
</tr>
<tr>
<td>Help option</td>
<td>The --help option displays a list of available options for the avrepl command: avrepl --help</td>
</tr>
</tbody>
</table>
Version option

The `--version` option displays the software version of the `avrepl` command:

```
avrepl --version
```

Target list

To replicate specific clients or Avamar domains, include a list of the clients and domains at the end of the `avrepl` command. Separate multiple entries with a space.

If you do not supply a list, then the replication includes all client backups on the source Avamar server.

Numeric plug-in descriptors

Some command options require one or more numeric plug-in descriptors as values. Valid numeric plug-in descriptors are listed in the following table.

<table>
<thead>
<tr>
<th>Descriptor</th>
<th>Plug-in name</th>
</tr>
</thead>
<tbody>
<tr>
<td>1000</td>

### CLI examples

Review the `avrepl` command examples for details on how to use options to control replication behavior.

Specify the following options with the `avrepl` command:

### Table 86 Required options for the `avrepl` command

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>--operation=replicate</code></td>
<td>Command operation for <code>avrepl</code>.</td>
</tr>
<tr>
<td><code>--[replscript]dpnname=source_server</code></td>
<td>Fully qualified domain name of the source Avamar server.</td>
</tr>
<tr>
<td><code>--[avtar]id=user@auth</code></td>
<td>User account for the source Avamar server. The default value is <code>repluser</code>. To use the repluser account, you can omit <code>--[avtar]id</code> and specify only the password for</td>
</tr>
</tbody>
</table>
### Table 86 Required options for the `avrepl` command (continued)

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>--password=password</code></td>
<td>Password for the user account on the source Avamar server.</td>
</tr>
<tr>
<td><code>--[replscript]dstaddr=destination_server</code></td>
<td>Destination Avamar server.</td>
</tr>
<tr>
<td><code>--[replscript]dstid=repluser</code></td>
<td>Specifies the Avamar user ID and domain to use for authentication on the destination Avamar server.</td>
</tr>
<tr>
<td><code>--[replscript]dstencrypt</code></td>
<td>Specifies the Avamar user ID and domain to use for authentication on the destination Avamar server.</td>
</tr>
<tr>
<td><code>--dstpassword=password</code></td>
<td>Specifies the password for repluser account on the destination Avamar server.</td>
</tr>
<tr>
<td><code>--dstap=password</code></td>
<td>Specifies the password for repluser account on the destination Avamar server.</td>
</tr>
<tr>
<td><code>--dstpswd=password</code></td>
<td>Specifies the password for repluser account on the destination Avamar server.</td>
</tr>
</tbody>
</table>

If the firewall is installed and enabled on the destination server, then specify the `--[replscript]dstencrypt` option with the correct encryption method, which is either `ssl` or `tls`.

### Replicating all client backups

The following command replicates all client backups from the `avamar-1.example.com` source server to the `replication-server-1.example.com` destination server. The user account on the source server is `jdoe@avamar` (the `jdoe` user account with the Avamar internal authentication system), and the password is `password`. The user account on the destination server is `repluser`, and the password is `password`.

```
avrepl --operation=replicate --
[replscript]dpname=avamar-1.example.com --[avtar]id=jdoe@avamar --
password=password --[replscript]dstaddr=replication-
server-1.example.com --[replscript]dstid=repluser --
dstpassword=password --[replscript]dstencrypt=ssl
```

### Replicating backups for specific clients or domains

The following command replicates all backups for the `client1` and `client2` clients, as well as for all clients in the `domain3` domain.

```
avrepl --operation=replicate --
[replscript]dpname=avamar-1.example.com --[avtar]id=jdoe@avamar --
password=password --[replscript]dstaddr=replication-
server-1.example.com --[replscript]dstid=repluser --
dstpassword=password --[replscript]dstencrypt=ssl client1 client2
```

### Note

The repluser account is the only user account that is known to work reliably on all destination servers.
Replicating specific types of backups
The following command replicates all full (level 0) backups that occurred after February 1, 2014 for the client1 and client2 clients.

```
avrepl --operation=replicate --
[replscript]dpnname=avamar-1.example.com --[avtar]id=jdoe@avamar --
ap=password --[replscript]dstaddr=replication-server-1.example.com --
[replscript]dstid=repluser --dstpassword=password --
[replscript]dstencrypt=ssl --[avtar]after=2014-02-01 --backup-
type=level0_full client1 client2
```

Monitoring replication

Monitor replication to ensure that it is completing successfully and to troubleshoot issues.

The Activity Monitor in Avamar Administrator enables you to view status information for both on-demand and scheduled replication activity, including both policy-based and cron-based replication.

Monitoring replication in Avamar Administrator

Procedure

1. In Avamar Administrator, click the Activity launcher button.
   The Activity window appears.
2. Click the Activity Monitor tab.
   A list of all activities appears.
3. To filter the results to display only replication activity, select Actions > Filter.
   The Filter Activity dialog box appears.
4. Select All Replication Source & Destination from the Type list.
5. Click OK.
6. To view statistics for a replication activity, select the activity and then select Actions > View Statistics.
   The Replicate Statistics dialog box appears. The Details tab provides detailed information from the v_repl_activities database view. The Backups tab provides a list of backups that were included in the replication operation. The Errors tab shows any errors that occurred during the replication operation.
7. Click Close.

Canceling a replication task

You can cancel a policy-based or cron-based replication task in the Activity Monitor any time before it completes. The cancellation might take five minutes or longer. The replication may complete before the cancellation finishes.

Procedure

1. In Avamar Administrator, click the Activity launcher button.
   The Activity window appears.
2. Click the Activity Monitor tab.
   A list of all activities appears.
3. Select the replication task from the list.
4. Select Actions > Cancel Activity.
   A confirmation message appears.
5. Click Yes.

Restoring by using a replica on a destination system

Restore replicated data from a client in the REPLICATE domain of a destination server.
The restore target can be any client that is a member of a domain on the destination server, including the client that is the source of the original backup.

Use this method to restore data from a replica when the source Avamar server is unavailable and when Replicas at Source is not enabled on the source Avamar system.

Procedure
1. Register and activate the client that is the restore target with the destination Avamar server that manages the replicated data:
   a. On a Windows client, right-click the Avamar system tray icon and select Manage > Activate Client.
      The Activate Client Setup dialog box appears.
   b. Type the hostname of the destination Avamar server in the Administrator Server Address box.
   c. Type 28001 in the Administrator Server Port box.
   d. Type the Avamar domain for the client in the Client Domain box.
   e. Click Activate.
      Client registration on page 50 provides instructions for other registration methods. You can also use Avamar Client Manager to activate clients with the destination server. Moving a client to a new server on page 301 provides instructions.

2. In Avamar Administrator, click the Backup & Restore launcher button.
   The Backup, Restore and Manage window appears.
3. Click the Restore tab.
   The upper left pane contains a list of domains.
4. Select the REPLICATE domain, and then select the hostname of the source Avamar server.
5. Select the domain that contains the client that is the source of the original backup.
6. Select the client from the list.
7. Click the By Date tab or the By File/Folder tab and select the data to restore.

Note
Restoring data from a backup on page 122 provides alternate methods to find a backup and perform a restore.
8. Select Actions > Restore Now.

The Restore Options dialog box appears.

9. Click Browse next to the Restore Destination Client box, and then browse to and select the client that is the restore target.

Do not select a client in the REPLICATE domain as the restore target. Select a client that is listed in the clients domain, or in another domain on the Avamar server.

10. Select the plug-in to use for the restore from the Restore Plug-in list.

11. From the Avamar encryption method list, select an encryption method for client/server data transfer during the restore.

Note

The encryption technology and bit strength for a client/server connection depend on several factors, including the client operating system and Avamar server version. The EMC Avamar Product Security Guide provides details.

12. Select either Restore everything to a different location or Restore everything to multiple locations.

13. Click Set Destination below the Items Marked for Restore list, and then select the destination paths for the data to restore.

14. To include plug-in options with this restore, click More Options, and then configure the settings.

15. Click OK on the Restore Options dialog box.

The Restore Request dialog box indicates that the restore was started.

16. Click Close.

17. (Optional) Change the registration of the restore target client back to the source Avamar server.

Perform this step when the source Avamar server is available.

MCS configuration parameters to support Replicas at Source

Configure MCS management of Replicas at Source through configuration parameters in mcserver.xml.

Changing the configuration of Replicas at Source on page 254 describes how to change mcserver.xml. The following table describes the Replicas at Source parameters in mcserver.xml.

<table>
<thead>
<tr>
<th>Container</th>
<th>Parameter</th>
<th>Default value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>repl</td>
<td>external_sync_interval_minute</td>
<td>120</td>
<td>Sets the number of minutes between tries to synchronize the replica metadata from the destination system to the MCS database on the source Avamar system. Setting get_backups_from_external_server to true overrides this parameter.</td>
</tr>
</tbody>
</table>
Table 87 MCS configuration parameters to support Replicas at Source (continued)

<table>
<thead>
<tr>
<th>Container</th>
<th>Parameter</th>
<th>Default value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>repl</td>
<td>allow_dest_replica_management</td>
<td>false</td>
<td>Set to <code>true</code> to permit synchronization of replica metadata between the remote destination system and the source Avamar server. Set to <code>false</code> to disable synchronization and effectively disable the Replicas at Source feature.</td>
</tr>
<tr>
<td>repl</td>
<td>get_backups_from_external_server</td>
<td>false</td>
<td>Set this value to <code>true</code> to override the default behavior and force MCS to obtain replica metadata directly from the destination system. By default, MCS obtains replica metadata from the destination system by periodic synchronization. This synchronization writes the metadata to the local MCS database on the source Avamar system. Avamar Administrator accesses the local database to provide replica information.</td>
</tr>
<tr>
<td>repl</td>
<td>show_external_backups</td>
<td>true</td>
<td>Set to <code>true</code> to enable the listing of replicas on the Restore tab. Set to <code>false</code> to disable the listing of replicas on the Restore tab.</td>
</tr>
<tr>
<td>ebms</td>
<td>ebms_home</td>
<td>lib/ mcebms.war</td>
<td>Sets the location of the web archive file for the external backup manager service.</td>
</tr>
<tr>
<td>ebms</td>
<td>ebms_descriptor</td>
<td>/WEB-INF/ web.xml</td>
<td>Sets the location of the XML descriptor file for the external backup manager service.</td>
</tr>
<tr>
<td>ebms</td>
<td>ebms_port</td>
<td>9090</td>
<td>Sets the inbound (listening) port for the external backup manager service.</td>
</tr>
<tr>
<td>ebms</td>
<td>ebms_use_https</td>
<td>true</td>
<td>Set to <code>true</code> to force the external backup manager service to use SSL/TLS encryption for communication with destination systems.</td>
</tr>
<tr>
<td>mon</td>
<td>ebmsIntervalMinutes</td>
<td>720</td>
<td>Sets the number of minutes between checks of the state of the Remote Backup Manager Service.</td>
</tr>
<tr>
<td>mon</td>
<td>ebmsFailEventIntervalMinutes</td>
<td>120</td>
<td>Sets the number of minutes between published updates of Remote Backup Manager Service stop events and fail events.</td>
</tr>
<tr>
<td>mon</td>
<td>ebmsMonitorTimeout</td>
<td>300</td>
<td>Sets the number of minutes to try to check the state of the Remote Backup Manager Service.</td>
</tr>
<tr>
<td>repl</td>
<td>allow_manage_remote_backups_at_source</td>
<td>true</td>
<td>Set to <code>true</code> to permit management of replicas on the source Avamar server. Management includes: Delete, Change Expiration, and Change Retention. Set to <code>false</code> to disable management of replicas on the source Avamar server.</td>
</tr>
</tbody>
</table>
Changing the configuration of Replicas at Source

To change the configuration of the Replicas at Source feature change the parameter values in mcserver.xml.

This topic describes how to change the Replicas at Source configuration parameters in mcserver.xml. Refer to MCS configuration parameters to support Replicas at Source on page 252 for descriptions of the configuration parameters.

Procedure

1. Open a command shell and log in by using one of the following methods:
   - For a single-node server, log in to the server as admin.
   - For a multi-node server:
     a. Log in to the utility node as admin.
     b. Load the admin OpenSSH key by typing:
        ```bash
        ssh-agent bash
        ssh-add ~admin/.ssh/admin_key
        ```
     c. When prompted, type the `admin_key` passphrase and press Enter.
2. Stop the MCS by typing the following command:
   ```bash
dpnctl stop mcs
   ```
3. Change the working directory by typing the following command:
   ```bash
cd /usr/local/avamar/var/mc/server_data/prefs
   ```
4. Open `mcserver.xml` in a text editor.
5. Find the container element of the parameter, and within that element, find the parameter.
6. Change the value of the parameter.
7. Save the change and close the file.
8. Start the MCS and the scheduler by typing:
   ```bash
dpnctl start mcs
dpnctl start sched
   ```
CHAPTER 11

Server Updates and Hotfixes

This chapter includes the following topics:

- Overview of the Avamar server software update process.................................256
- Installing and configuring the Avamar Downloader Service.............................258
- Downloading new packages from the EMC repository......................................262
- Viewing a list of packages available for download...........................................262
- Verifying connectivity with the EMC repository.............................................263
- Monitoring Avamar Downloader Service status.............................................263
- Stopping and starting the Avamar Downloader Service monitor.......................264
- Troubleshooting Avamar Downloader Service issues......................................264
- Downloading and installing packages on the Avamar server.............................265
- Viewing a list of installation packages on the Avamar server............................266
- Deleting packages from the Avamar server..................................................267
- Viewing the history of installations..................................................................268
Overview of the Avamar server software update process

EMC periodically provides updates and hotfixes for the Avamar server software. EMC stores update packages and hotfix packages in the EMC repository. Use the Avamar Downloader Service to download the installation packages to a local Windows server and then push the packages to an Avamar server. Then use Avamar Installation Manager to install the packages on the Avamar server.

This process minimizes network bandwidth usage by enabling you to download files from the EMC repository one time (to the Avamar Downloader Service computer) and then distribute the files to each Avamar server by using Avamar Installation Manager.

When required, you can remove old installation packages from the local repository on the Avamar server and then download them from the Avamar Downloader Service computer again.

If Internet access is unavailable, manually copy packages to the /data01/avamar/repo/packages directory on the utility node or single-node server instead of using the Avamar Downloader Service. Then use Avamar Installation Manager to install the packages on the Avamar server.

Avamar Downloader Service

The Avamar Downloader Service downloads software packages from the EMC repository to a single local computer. You can then distribute the packages to all Avamar servers in the environment.

EMC Customer Support typically installs the Avamar Downloader Service software during the installation or upgrade of an Avamar server. You can also download the Avamar Downloader Service from the Avamar server and install the software yourself.

The Avamar Downloader Service computer is a standalone Microsoft Windows computer with network access to EMC sites on the Internet and to all internal Avamar servers. If the Avamar Downloader Service computer is on a private network with restrictions on access to the EMC repository server, then you can set up a proxy server for communication between the Avamar Downloader Service computer and the EMC repository server.

The Avamar Downloader Service runs as a Windows service to monitor the EMC repository. A desktop shortcut, task tray icon, and Windows Start menu items provide access to the Avamar Downloader Service user interface, which enables you to configure the Avamar Downloader Service and check the EMC repository for installation packages. The Avamar Downloader Service monitor contains status messages for the service.

Local repository

The C:\Program Files\EMC\Avamar Downloader Service\repository directory on the Avamar Downloader Service computer serves as the local repository for downloaded installation packages.

Note

Do not rename client installation packages. The Avamar push upgrade mechanisms are incompatible with renamed packages.

The manifest.xml file in the local repository contains a list of all server, client, and workflow packages that are currently available for download from the EMC repository.
Security
The Avamar Downloader Service encrypts outgoing communication to the EMC repository by using SSL (Secure Socket Layers) over an HTTP connection. The Avamar Downloader Service validates each package that it downloads to ensure the package has been correctly signed and transmitted.

Also, the Avamar Downloader Service accepts incoming requests for installation packages only from Avamar systems that are on a known systems list.

AvInstaller and Avamar Installation Manager

The AvInstaller process controls the download and installation process for installation packages on the Avamar server. Use Avamar Installation Manager to manage the AvInstaller process.

Installation
EMC Customer Support installs AvInstaller during the installation or upgrade of an Avamar server. AvInstaller is installed on the utility node in a multi-node environment or the server in a single-node environment.

Local repository
AvInstaller uses the `/data01/avamar/repo/packages` directory on the Avamar utility node or single-node server serves as the local repository for downloaded installation packages. AvInstaller also manages a temporary directory that is used to extract the packages during installation.

To determine if new packages are available, the Avamar Downloader Service automatically downloads the manifest file from the EMC repository once a day. Then the Avamar Downloader Service sends the updated manifest file to the local repository for each known Avamar system. AvInstaller uses the manifest file to obtain current information about all software packages that are available for download from the EMC repository.

User interface
Use the Avamar Installation Manager user interface to manage AvInstaller. Avamar Installation Manager is installed automatically with AvInstaller. Avamar Installation Manager provides the following features:

- Download software packages from the Avamar Downloader Service computer.
- Install the packages on the Avamar server.
- View a list of the software packages in the repository of the Avamar server.
- Delete old installation packages from the Avamar server to reclaim storage.
- View the software installation history for the Avamar server.
Installing and configuring the Avamar Downloader Service

The following topics explain how to prepare for, install, and configure the Avamar Downloader Service software on a Microsoft Windows system, as well as how to update and uninstall the software.

Avamar Downloader Service installation requirements

The Avamar Downloader Service is available as either a 32-bit or 64-bit application. You install the Avamar Downloader Service on a Microsoft Windows server that has network access to the Avamar server. This system can be a desktop or laptop system.

The following table provides the installation requirements for the computer on which you install the Avamar Downloader Service.

Table 88 Installation requirements for the Avamar Downloader Service

<table>
<thead>
<tr>
<th>Software/hardware</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>Operating system</td>
<td>• Microsoft Windows Server 2012 (64-bit only)</td>

</tbody>
</table>

Downloading the Avamar Downloader Service software

Download the Avamar Downloader Service software from the EMC Avamar Web Restore page on the Avamar server.

Procedure

1. Log in to the Windows host system as an administrator.
2. Type the URL of the Avamar server into the web browser:

   http://Avamar_server

   where Avamar_server is the Avamar system network hostname (as defined in DNS) or IP address.

   The EMC Avamar Web Restore page appears.
3. Click Downloads.

   The Downloads list appears.
4. Click + next to the platform heading for the Windows computer.
5. Click + next to the operating system heading for the Windows computer.
6. Click the link for AvamarDownloaderService-windows-platform-version.exe.

   where:
Installing the Avamar Downloader Service software

Procedure
1. Log in to the Windows host computer as an administrator.
2. Navigate to the directory that contains `AvamarDownloaderService-windows-platform-version.exe`, and then double-click the file to start the installation.

   The setup wizard opens, starting with the welcome page.
3. Click Next.

   The Destination Folder page appears.
4. Specify the folder for the Avamar Downloader Service installation:
   - To accept the default folder, `C:\Program Files\EMC\Avamar Downloader Service`, click Next.
   - To specify a different folder, click Change and then browse to the folder. Then click Next.

   The Ready to install Avamar Downloader Service page appears.
5. Click Install.

   The Installing Avamar Downloader Service page appears and displays the progress of the installation. After the installation completes, the Completed the Avamar Downloader Service Setup Wizard page appears.
6. Click Finish.

   The installation adds an Avamar Downloader Service icon to the Control Panel and the system tray. The installation also adds the `AvamarDownloaderService` to Windows Services.

Enabling HTTPS

HTTPS functionality must be enabled on the Microsoft Windows computer hosting the Avamar Downloader Service. In some circumstances, HTTPS might already be enabled on the computer. If not, perform the following steps on the computer.

Procedure

   The Windows Firewall with Advanced Security console appears.
2. In the navigation pane, click Outbound Rules.
3. In the Actions pane, click New Rule.

   The New Outbound Rule Wizard appears.
4. Select Port, and then click Next.
5. Select Specific remote ports, enter 443 in the text box, and click Next.
6. Click Allow the connection and click Next.
7. Accept the default settings and click **Next**.
8. Provide a name for the outbound rule (for instance, “Avamar Downloader Service”) and click **Finish**.
   
   The **New Outbound Rule Wizard** appears.
9. In the Outbound Rules pane, right-click the outbound rule you created above (should be at the top of list) and select **Properties**.
   
   The **Properties** window appears.
10. Select the **Programs and Services** tab.
11. Click **Settings**.
12. Select **Apply to this service**.
13. From the list of services, select Avamar Downloader Service and click **OK**.
14. Click **Apply** and then **OK**.
15. Close the **Windows Firewall with Advanced Security** console.

**Configuring the Avamar Downloader Service**

Configure Avamar Downloader Service before using it to download packages from the EMC repository server. Configuration tasks include verifying the connection, building a known systems list, and specifying proxy server settings.

**Before you begin**

Install the Avamar Downloader Service software.

**Procedure**

1. On the Avamar Downloader Service computer, right-click the Avamar Downloader Service task tray icon and select **Configure Service**.
   
   The Avamar Downloader Service configuration wizard opens, starting with the welcome page.
2. (Optional) To use the local version of the **manifest.xml** file, select **Disable Internet access. Use only local files**.
   
   Use this option when the Avamar Downloader Service computer cannot connect over the Internet with the EMC repository.
3. On the welcome page of the configuration wizard, click **Next**.
   
   The **EMC Credentials** page appears.
4. On this page, specify the EMC Online Support **Username** and **Password** (plus confirmation) that you received with the EMC Avamar license at the time of product purchase, and then click **Next**.
   
   The **Proxy Configuration** page appears.
5. (Optional) Specify the hostname or IP address and the port number for the proxy server as well as EMC credentials: **Username**, **Password**, and **Confirm Password**.
   
   Supply proxy server information to use a proxy server as an intermediary for requests from the Avamar Downloader Service computer to the EMC repository server. The page also allows you to select **Use Authentication**.
For example, use a proxy server when the Avamar Downloader Service computer is on a private network and access to the EMC repository server is restricted.

6. Click Next.

The Avamar Systems page appears.

7. Click Add.

The Avamar Downloader Service - Add Known System dialog box appears.

8. Specify the hostname, username, and password for an Avamar server:
   a. In the Hostname box, type the IP address or hostname for the Avamar server.
   b. In the Username box, type root to specify the Linux operating system root user.
   c. In the Password and Confirm Password boxes, type the password for the root user.

9. Click OK.

   When the configuration process cannot resolve the hostname, an informational message appears. Click Yes to add the system or No to cancel the add operation. You can add systems with unresolvable hostnames, such as offline systems, to the known systems list.

10. Add other Avamar servers.

11. After all Avamar servers have been added, click Next.

   The Review Configuration page appears.

12. Review the configuration details, and then click Finish.

   After you finish

   When required, rerun the configuration wizard to edit the hostname, IP address, or port number for a proxy server, or to edit the known systems list to add and remove Avamar servers.

**Updating the Avamar Downloader Service software**

Use the Avamar Downloader Service to check for updates of the Avamar Downloader Service software, and to download and install the updates.

**Procedure**

1. Right-click Avamar Downloader Service task tray icon and select Check for Updates.

   If an update is available, the message Update is ready to install appears.

   If no updates are available, then the message Your software is up to date appears.

   The Avamar Downloader Service Updater dialog box appears.

2. When an update is available, click Install.

   The Avamar Downloader Service setup wizard appears.

3. Follow the prompts to continue through the wizard and install the new software build.
Uninstalling the Avamar Downloader Service

Uninstall Avamar Downloader Service through the Windows Programs and Features console.

Procedure
1. On the Avamar Downloader Service computer, close all running applications.
2. Open the Windows Programs and Features console from the Control Panel.
3. In the Name column, select Avamar Downloader Service.
4. Click Uninstall.

Results
The uninstall process removes all files, including file cache contents, configuration items, and Windows registry entries for the Avamar Downloader Service.

Downloading new packages from the EMC repository

You can check the EMC repository for new server, client, and workflow packages, and then download the packages to install them.

Before you begin
Ensure that the status of the Avamar Downloader Service is either OK or Waiting for configuration. Otherwise, you cannot check for new packages.

Procedure
1. Right-click the Avamar Downloader Service task tray icon and select Check for New Packages.
   The Check for New Packages dialog box appears and provides status messages while the Avamar Downloader Service downloads the manifest file from the EMC repository server to the local repository on the Windows server and to Avamar servers on the known systems list.
   A check mark next to a status message indicates that the process was successful. An X next to a status message indicates that the process failed.
2. To view details about failed processes, double-click the X next to the status message.
3. Click Close on the Check for New Packages dialog box.

Viewing a list of packages available for download

The manifest.xml file in the repository folder on the Avamar Downloader Service computer contains a list of software packages that are currently available for download from the EMC repository.

Procedure
1. Right-click the Avamar Downloader Service task tray icon and select Open Repository.
   Windows Explorer opens and displays the C:\Program Files\EMC\Avamar Downloader Service\repository folder, which contains the manifest.xml file.
2. Open the manifest.xml to view the package information.
Package names use the .avp file name extension and appear within <filename> tags.

Verifying connectivity with the EMC repository

After editing repository connection settings, or after package download failures, verify that the Avamar Downloader Service computer can connect to the EMC repository server.

Procedure
1. Right-click the Avamar Downloader Service task tray icon and select Run Diagnosis.
   
   The status of the process appears in the Run Diagnosis dialog box. An X next to a status message indicates a problem with the network connection. Click the X next to failures to view more information about the error in the Error Information dialog box.
   
   The Run Diagnosis dialog box appears, and the process to check network connectivity starts automatically.
2. (Optional) To stop the verification process before it completes, click Stop System Check.
3. When the verification completes, click Close.

Monitoring Avamar Downloader Service status

The Avamar Downloader Service monitor automatically starts when you log in to the Avamar Downloader Service computer. Use the monitor to view the status of the Avamar Downloader Service.

Procedure
- To view the status from the monitor, hover the mouse over the Avamar Downloader Service task tray icon.

   A popup window with a status message appears.

   The following table describes Avamar Downloader Service monitor status messages.

Table 89 Avamar Downloader Service monitor status messages

<table>
<thead>
<tr>
<th>Status message</th>
<th>Description</th>
</tr>

### Stopping and starting the Avamar Downloader Service monitor

The Avamar Downloader Service monitor starts automatically when you log in to the Avamar Downloader Service computer.

**Procedure**

- To stop the monitor, right-click the Avamar Downloader Service task tray icon and select **Exit**.
- To start the monitor, open the Windows **Start** menu and select **All Programs** > **EMC Avamar Downloader Service version** > **Avamar Downloader Service Monitor**.

### Troubleshooting Avamar Downloader Service issues

Resolve common issues with the Avamar Downloader Service.

**Package download fails**

SYMPTOM: The utility node or the single-node server cannot access the Windows host computer, and a message similar to the following message appears when downloading a package.

The selected package cannot be downloaded.
RESOLUTION: Add a line to the /etc/hosts file on the utility node with the IP address, fully qualified domain name, and short name of the Avamar Downloader Service computer.

SAMPLE ENTRY: 10.6.172.50 avamar-1.example.com avamar-1

Temporary IPv6 addresses cause package download to fail

SYMPTOM: The Avamar Downloader Service fails to download a package and displays connection refused errors.

POSSIBLE CAUSE: Temporary IPv6 addresses are in use on all operating systems. The connection refused errors are due to the use of temporary IPv6 addresses. Windows Vista, Windows 2008 Server, or later versions of Windows use temporary IPv6 addresses by default.

RESOLUTION: To work around this issue, block temporary IPv6 addresses on the Avamar Downloader Service computer. Type each of the following netsh commands at the command prompt on the Avamar Downloader Service computer. Type each netsh command on a separate line.

```
netsh interface ipv6 set privacy state=disabled store=active
netsh interface ipv6 set privacy state=disabled store=persistent
netsh interface ipv6 set global randomizeidentifiers=disabled store=active
netsh interface ipv6 set global randomizeidentifiers=disabled store=persistent
```

**Downloading and installing packages on the Avamar server**

Use Avamar Installation Manager to download and install software packages, patches, and hotfixes.

**Before you begin**

Use a computer with at least 2 GB of RAM.

**Procedure**

1. Open a web browser and log in to Avamar Installation Manager:
   a. Type the following URL:

   ```
   https://Avamar-server/avi
   ```
   where Avamar-server is the IP address or the resolvable hostname of the Avamar server.

   The Avamar Installation Manager login page appears.

   b. Type the username of the Avamar administrator user account in the User Name field and the password in the Password field.

   c. Click Login.

2. If a Download button appears for the package, click the button to download the package to the local repository.

   After the download completes, the Download button is replaced with an Install button and a Delete button.

3. To start the installation, click Install.

   The background color for the package changes to yellow and the initialization begins. When the initialization process completes, the Installation Setup page appears.
4. Provide installation setup information.
   Some packages do not require setup information.
5. To provide advanced settings, select Show advanced settings.
6. Click Continue.
   The Installation Progress page displays the status of the installation.
   **NOTICE**
   If you close the browser during the installation of a package, the installation pauses but does not stop. To resume the installation, open a browser window and log in to Avamar Installation Manager. The installation continues from the point that the browser window closed.
7. Respond to all installation prompts.
   After the installation completes, the Install button becomes a Run button for workflow packages. The Run button enables you to run the workflow package again.

### Viewing a list of installation packages on the Avamar server

View a list of installation packages in the repository on an Avamar server on the Repository tab of Avamar Installation Manager.

**Procedure**

1. Open a web browser and log in to Avamar Installation Manager:
   a. Type the following URL:
      ```
      https://Avamar-server/avi
      ```
      where Avamar-server IP address or resolvable hostname of the Avamar server.
      The Avamar Installation Manager login page appears.
   b. Type the username of the Avamar administrator user account in the User Name field and the password in the Password field.
   c. Click Login.
2. Click Repository.
   The Repository tab appears.
3. (Optional) Toggle the sort order of the packages in the list by clicking a column heading.

**Repository tab headings**

The packages in the repository on an Avamar server appear on the Repository tab of Avamar Installation Manager. The most recently installed package appears at the bottom of the list.

The following table describes the information that appears for each package.

**Table 90 Information on the Repository tab**

<table>
<thead>
<tr>
<th>Heading</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FileName</td>
<td>The name of the package.</td>
</tr>
</tbody>
</table>
### Table 90 Information on the Repository tab (continued)

<table>
<thead>
<tr>
<th>Heading</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Checksum</td>
<td>The checksum that the AvInstaller service calculated for the package. Compare this data with the checksum in the manifest file.</td>
</tr>
<tr>
<td>Status</td>
<td>The status of the package:</td>
</tr>
<tr>
<td></td>
<td>• Waiting — The AvInstaller service is copying the package to the EMC repository.</td>
</tr>
<tr>
<td></td>
<td>• Checksum — The AvInstaller service is calculating the package checksum.</td>
</tr>
<tr>
<td></td>
<td>• Unsigning — The AvInstaller service is verifying the package signature.</td>
</tr>
<tr>
<td></td>
<td>• Extracting — The AvInstaller service is extracting the package from the tarball.</td>
</tr>
<tr>
<td></td>
<td>• Accepted — The package is fully downloaded to the EMC repository and is ready to be installed.</td>
</tr>
<tr>
<td></td>
<td>• Rejected — Either the package was rejected due to a problem in transit or it was downloaded successfully but was not applicable to the system in its current state.</td>
</tr>
<tr>
<td>Note</td>
<td>A brief description of the status.</td>
</tr>
<tr>
<td>Last Updated</td>
<td>The date and time of the last status update.</td>
</tr>
</tbody>
</table>

### Deleting packages from the Avamar server

After you successfully install a software package, the AvInstaller service automatically deletes the package from the repository on the Avamar system. Manually delete packages that are not installed.

Only EMC Customer Support can delete restricted packages.

**Procedure**

1. Open a web browser and log in to Avamar Installation Manager:
   a. Type the following URL:
      
      ```
      https://Avamar-server/avi
      ```
      
      where `Avamar-server` IP address or resolvable hostname of the Avamar server.
      
      The Avamar Installation Manager login page appears.
   b. Type the username of the Avamar administrator user account in the **User Name** field and the password in the **Password** field.
   c. Click **Login**.
2. In the **Package List**, select a package.
3. Click the **Delete** button next to the package.
   A confirmation message appears.
4. Click **Yes**.
Viewing the history of installations

You can view a history of the software installations, updates, and hotfixes for an Avamar server on the History tab of Avamar Installation Manager.

Procedure

1. Open a web browser and log in to Avamar Installation Manager:
   a. Type the following URL:
      https://Avamar-server/avi
      where Avamar-server is the IP address or resolvable hostname of the Avamar server.
      The Avamar Installation Manager login page appears.
   b. Type the username of the Avamar administrator user account in the User Name field and the password in the Password field.
   c. Click Login.
2. Click History.
   The History tab appears.
3. (Optional) Toggle the sort order of the packages in the list by clicking the heading of any column.
4. (Optional) Filter the list of packages by selecting a filter value from the Show list.
5. (Optional) View details about a package in the list by selecting the row for the package.
6. (Optional) View the log file for a packages that has a processing status by clicking Logs in the Details table.
7. (Optional) Export the log information to a Microsoft Excel or PDF file by clicking Export.

Installation history information

History columns
The following table describes the information that appears on the Avamar Installation Manager History tab for each package.

<table>

Overview of Avamar Client Manager

Avamar Client Manager is a web-based management application that provides centralized Avamar client administration capabilities for larger businesses and enterprises. Avamar Client Manager facilitates the management of large numbers of Avamar clients.

Avamar Client Manager works with Avamar clients on a supported native operating system and Avamar clients on a supported operating system running in a VMware virtual machine. Avamar Client Manager cannot work with Avamar clients through virtual center, virtual machine, or virtual proxy configurations. The Avamar Client Manager UI displays supported Avamar clients and hides all unsupported clients.

Connection security

To secure data transmissions between a computer and the Avamar server, a secure connection is created using HTTPS.

This form of the HTTP protocol encrypts messages before they are sent and decrypts them when they are received. HTTPS is used for all login transmissions and for all transmission of data during registration and activation operations.

All attempts to access the Avamar server through the UI over standard HTTP protocol are redirected to HTTPS to prevent plain text transmissions.

Apache web server authentication

The Avamar Client Manager UI uses only secure web pages, and an authentication warning appears in web browsers that access those pages unless you install a trusted public key certificate on the Apache web server that is provided with Avamar.

The EMC Avamar Product Security Guide describes how to obtain and install a trusted public key certificate for the Apache web server.

Editing the session time-out period

When a session has been running for 72 hours or more without any interaction between the web browser and the Avamar Client Manager server, Avamar Client Manager ends the session. The automatic session time-out protects the security of the assets accessible through Avamar Client Manager. You can increase or decrease the time-out period.

When Avamar Client Manager ends a session, close the web browser window or tab in which the session was running, and restart Avamar Client Manager. Avamar Client Manager does not end a session while a commit task is in progress.

Procedure

1. Open a command shell and log in by using one of the following methods:
   - For a single-node server:
     a. Log in to the server as admin.
     b. Switch user to root by typing `su -`.
   - For a multi-node server:
     a. Log in to the utility node as admin.
     b. Load the dpnid OpenSSH key by typing:
ssh-agent bash
nen ssh-add ~admin/.ssh/dpnid
c. When prompted, type the dpnid passphrase and press Enter.

2. Stop the EM Tomcat server by typing `dpncntl stop emt`.

3. Open the following file in a text editor:
   `/usr/local/avamar-tomcat/webapps/aam/WEB-INF/web.xml`

4. **Change the value of the session-timeout tag to a new value in minutes.**
   The following example illustrates the session-timeout tag with the default value of 4320 minutes (72 hours):
   ```xml
   <session-config>
     <session-timeout>4320</session-timeout>
   </session-config>
   ```

5. Save and close the file.

6. Start the EM Tomcat server by typing `dpncntl start emt`.

### Increasing the JavaScript time-out period

The Avamar Client Manager UI uses JavaScript to perform many of its tasks. Sometimes an Avamar Client Manager UI script requires more time to finish than is permitted by a web browser’s default script time-out value.

When this happens, a message appears and the script is stopped. You can click continue to allow the script to finish its work.

To avoid seeing this message, increase the script time-out period. The steps depend on the web browser.

### Increasing the JavaScript time-out period in Internet Explorer on Windows

**Procedure**

1. Open a registry editor, such as `Regedt32.exe`.

2. Open the following registry key:
   ```
   HKEY_CURRENT_USER\Software\Microsoft\InternetExplorer\Styles
   ```
   If the key does not exist, create it.

3. **Create a DWORD value called MaxScriptStatements under the key.**

4. **Set the value of the DWORD to 20,000,000.**
   This number represents the number of script statements.

5. Restart the web browser.

### Increasing the JavaScript time-out period in Firefox

**Procedure**

1. In the browser address bar, type `about:config`.
   A warning message appears.

2. Click **I'll be careful, I promise!**.
   The preferences window opens.
3. In Filter, type `dom.max_script_run_time`.
   The script runtime preference appears.
4. Double-click the preference.
   The Enter integer value dialog box appears.
5. Type 30 and click OK.
6. Restart the browser.

### Avamar Client Manager configuration properties

Avamar Client Manager normally does not require any changes to its default configuration. However, some properties can be adjusted to suit a particular deployment requirement.

Avamar Client Manager properties are in the `/usr/local/avamar/etc/acm.properties` file.

The following table provides information about the properties.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>activation.retry.attempts</code></td>
<td>The number of times a failed move task is retried.</td>
<td>24</td>
</tr>
<tr>
<td><code>activation.retry.frequency.minutes</code></td>
<td>The number of minutes between client activation tries.</td>
<td>120</td>
</tr>
<tr>
<td><code>move.getactivities.retry.attempts</code></td>
<td>The number of checks to determine whether a client is inactive (so that it can be moved).</td>
<td>7</td>
</tr>
<tr>
<td><code>move.getactivities.frequency.seconds</code></td>
<td>The number of seconds between checks to determine whether a client is inactive (so that it can be moved).</td>
<td>5</td>
</tr>
<tr>
<td><code>move.queue.error.codes</code></td>
<td>Sets a comma-separated list of error codes that determine whether a move task failure is added to the queue. A move is only added to the queue if its failure generates one of these error codes. Use the value <code>none</code> to prevent all failed move tasks from being added to the queue. Use the value <code>empty</code> to add all failed move tasks to the queue.</td>
<td>22271, 22280, 22282, 22295, 30006, 30012, 30016, 30017, 30019</td>
</tr>
<tr>
<td><code>move.retry.attempts</code></td>
<td>Sets the number of times a failed move task is retried.</td>
<td>24</td>
</tr>
<tr>
<td><code>move.retry.frequency.minutes</code></td>
<td>Sets the span of time in minutes between retry tries.</td>
<td>120</td>
</tr>
<tr>
<td><code>orgu.name.append.domain</code></td>
<td>Determines whether clients displayed in the Client Information area of the UI are listed using the client hostname or FQDN. The default value displays the FQDN for each client.</td>
<td>true</td>
</tr>
<tr>
<td><code>toolbar.displaytime.client</code></td>
<td>Determines whether time displayed within Avamar Client Manager uses the time zone of the web browser’s host computer or time zone of the</td>
<td>true</td>
</tr>
</tbody>
</table>
Table 93 Avamar Client Manager configuration properties (continued)

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Avamar server. The default value uses the time zone of the web browser's host computer.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>upgrade.freeform.flags</td>
<td>Provides a way to pass key/value flags to upgrade work orders. The value is a comma separated list of KV pairs. For example: upgrade.freeform.flags=key1=val1,key2=val2,key3=val3</td>
<td>No default value</td>
</tr>
</tbody>
</table>

Changing an Avamar Client Manager configuration property

Procedure
1. Open a command shell and log in by using one of the following methods:
   - For a single-node server:
     a. Log in to the server as admin.
     b. Switch user to root by typing `su -`.
   - For a multi-node server:
     a. Log in to the utility node as admin.
     b. Load the dpnid OpenSSH key by typing:
        
        `ssh-agent bash
        ssh-add ~admin/.ssh/dpnid`
     c. When prompted, type the dpnid passphrase and press Enter.
2. Change the current working directory by typing the following command:
   `cd /usr/local/avamar/etc`
3. Open the Avamar Client Manager properties file, `acm.properties`, in a text editor.
4. Edit the value of the property.
5. Save and close the file.
6. Restart the EM Tomcat server by typing:
   `dpnctl stop emt
   dpnctl start emt`

Starting Avamar Client Manager

Start Avamar Client Manager by typing the Avamar Client Manager URL in a web browser. Avamar Client Manager can also be started within Backup & Recovery Manager.

Procedure
1. Open a web browser and type the following URL:
   `https://Avamar_server/aam`
   where `Avamar_server` is the resolvable hostname or IP address of the Avamar server that is running the Avamar Client Manager process.
2. In **User Name**, type the username of an administrator account on the Avamar server.
3. In **Password**, type the password for the account.

**Results**
Avamar Client Manager opens to **Server Summary** section of the Overview page.

**Login page**

The login page limits access to the Avamar Client Manager UI by requiring a username and a password.

The login page authenticates the username and the password through comparison with administrator accounts registered on the Avamar server. Avamar Client Manager only allows access for accounts with administrator privileges on the Avamar server that is running the Avamar Client Manager process.

After a successful login, the Avamar Client Manager UI opens to the **Server Summary** section of the Overview page.

**Global tools**

Avamar Client Manager provides several tools that you can use with more than one page. Use these tools to help with the following tasks:

- Adding an Avamar server
- Removing an Avamar server
- Changing the settings for an Avamar server
- Selecting an Avamar server to work with
- Filtering a page's summary view
- Viewing context relevant details
- Exporting information from a page
- Enabling tool tips

**Adding an Avamar server**

To enable management of the Avamar clients of an Avamar server, add the Avamar server to Avamar Client Manager.

**Before you begin**

Determine the following information:

- The resolvable hostname or IP address of the Avamar server.
- The inbound RMI port on the Avamar server.
- The password for the MCUser account on the Avamar server.

**Procedure**

1. Browse to the **Server Summary** section of the Overview page.
2. Click **Add Server**.
   - The **Add Server** window appears.
3. In **System name (or) IP**, type the resolvable hostname, or IP address, of the Avamar server.
4. In **Port**, type the inbound RMI port for the Avamar server. The field appears with the default value of 9443. Leave the default value unchanged unless a non-default port is used on the Avamar server.

5. In **MCUser Password**, type the password for the MCUser account on the Avamar server.

6. Click **Save**.

**Results**

Avamar Client Manager checks the values and adds the Avamar server.

---

**Removing an Avamar server**

To stop management of the Avamar clients of an Avamar server, remove the Avamar server from Avamar Client Manager.

**Procedure**

1. Browse to the **Server Summary** section of the Overview page.
2. Select the Avamar servers to remove.
   - The Avamar server that hosts the Avamar Client Manager process cannot be removed.
3. Click **Remove Server**.
   - A warning dialog box appears.
4. Click **Yes**.

**Results**

Avamar Client Manager removes the selected Avamar servers from the group of managed servers.

---

**Changing the settings for an Avamar server**

Changes on an Avamar server to the inbound RMI port or to the password for the MCUser account prevent management of the Avamar server by Avamar Client Manager. Edit the stored settings for the Avamar server to reenable management by Avamar Client Manager.

**Before you begin**

Determine the following information:

- The new inbound RMI port on the Avamar server.
- The new password for the MCUser account on the Avamar server.

**Procedure**

1. Suspend all activity on the Avamar server.
   - [Suspending and resuming server activities on page 150](#) describes how to suspend Avamar server activity.
2. Browse to the **Server Summary** section of the Overview page.
3. Select an Avamar server.
4. Click **Edit Server**.
   - The **Edit Server** window appears.
5. In **Port**, type the inbound RMI port on the selected Avamar server.
6. In **MCUser Password**, type the password for the MCUser account on the selected Avamar server.

7. Click **Save**.

**Results**

Avamar Client Manager checks the values and reestablishes management of the Avamar server.

**Selecting a server**

Use the server selection field to display, and work with, information for a specific server.

**Before you begin**

Expand the **Navigation** panel on the left side of the UI so that the server selection field is visible at the top of the panel. Browse to a page that displays the server selection field in an active, selectable, state.

**Procedure**

1. On the server selection field, click the arrow icon.
   
   When the server selection field is not visible, expand the **Navigation** panel on the left side of the UI. When the server selection field is not relevant to the current page view it appears in a dimmed state, that is, it is not active and selectable.

2. From the list of servers, select a server.
   
   The page view refreshes. Information about the server and its tasks appears.

**Filters**

Avamar Client Manager offers you a wide range of filters.

Use a filter to determine which objects appear in the list on the current page. Filters work with a variety of objects. The type of object and the available filters depend on the page’s context. In Avamar Client Manager you can filter the following types of objects:

- Servers
- Clients
- Policies
- Groups
- Tasks
- Log entries

Filters that apply to the current context appear on the Filters bar at the top of the page.

**Searching by name**

To find objects by comparing a search string to object names, use the search field.

**Before you begin**

Browse to a view that has one of the following search-enabled fields on the **Filters** bar:

- User name
- Client name
- Group name
- Domain name

Use search to limit the list to objects with the same and similar names.
Procedure

1. Click the arrow next to the search-enabled field.
   A text entry box appears.

2. In the text entry box, type a search string.
   Avamar Client Manager compares the search string that you type to the names of
   objects and includes matching objects on the list. Objects match when a portion of
   the name contains the search string.

3. Click the magnifying glass icon.

Results

Avamar Client Manager refreshes the list and only objects with names that match the
search string appear.

Example 1  Searching by username

To include all clients that have a user with the characters "eng" in their username, type
*eng* in the text entry field.

After you finish

(Optional) To remove the search string and to display all objects, click X next to the text
entry field.

Search string rules

A search string is one or more characters that you type into a name search field. Avamar
Client Manager compares the search string with all object names. When the search string
matches all or part of an object's name, Avamar Client Manager adds the object's name
to the results.

The following rules apply to a search string:

- No more than 24 characters
- Can use an asterisk (*) character to represent zero or more characters
- Cannot start with a period character
- Cannot include any of the characters listed in the Character column of the following
table:

Table 94 Characters not allowed in search strings

</table>

a. An exception to this exclusion permits the solidus character in the Domain Name filter on the Policies page.

Using the activity type filter

Use the activity type filter to limit a list to one type of activity.

Before you begin
Browse to a view that includes Activity Type on the Filters bar.

Procedure
1. On the Filters bar, click the arrow next to Activity Type.
   A selection list appears, with the values: Backup and Restore.
2. Select a value.
   Select Backup to include only backup tasks in the list. Select Restore to include only restore tasks in the list.
   For example, in the Idle Clients section of the Clients page, select Backup on the Activity Type filter. Avamar Client Manager limits the list to clients without any backup activity during the defined period.

Results
Avamar Client Manager filters the results using the activity type that you selected.
Using the client status filter

Use the client status filter to add clients with the specified client status to the list.

**Before you begin**
Browse to a view that includes Client Status on the Filters bar.

**Procedure**
1. On the Filters bar, click the arrow next to Client Status.
   A selection list of the client statuses for all clients in that context appears.
2. Select a status.
   For example, in the Add Clients section of the Clients page, select Activation Failure on the Client Status filter. Avamar Client Manager limits the list to registered computers with at least one unsuccessful activation try.
   Avamar Client Manager refreshes the list. Only entries with the selected client status appear on the list.
3. (Optional) Repeat the steps to select additional statuses.

**Results**
Avamar Client Manager refreshes the list. Only entries with the selected client statuses appear on the list.

Using the failure criteria filter

Use the failure criteria filter to define which clients Avamar Client Manager includes in a list of failed clients.

**Before you begin**
Browse to a view that includes Failure Criteria on the Filters bar.

**Procedure**
1. On the Filters bar, click the arrow next to Failure Criteria.
   A selection list appears, with the values: At least one activity failed, All activities failed, and Last activity failed.
2. Select a value.
   The value that you select determines which clients Avamar Client Manager includes in the list of failed clients. Avamar Client Manager includes only clients that match the selected activity status.
   For example, select Last activity failed. Avamar Client Manager refreshes the list and includes clients only when their most recent activity failed. The failed activity can be either a backup or a restore.

**Results**
Avamar Client Manager refreshes the list. Only clients with an activity status that matches the selected value appear on the list.

Using the OS filter

Use the OS filter to limit a list to clients with specific operating systems.

**Before you begin**
Browse to a view that includes OS on the Filters bar.
**Procedure**

1. On the **Filters** bar, click the arrow next to **OS**.
   - A list of the OS versions of all clients in that context appears.
2. Select an OS version.
   - Avamar Client Manager refreshes the list. Only clients with the selected OS version appear on the list.
3. (Optional) Repeat the steps to select additional OS versions.

**Results**

Avamar Client Manager refreshes the list. Only clients with the selected OS versions appear on the list.

**Using the period filter**

Use the period filter to define the calendar date boundaries of the displayed results.

**Before you begin**

Browse to a view that includes **Period** on the **Filters** bar.

**Procedure**

1. On the **Filters** bar, click the arrow next to **Period**.
   - A selection list appears, with the values: **Before**, **After**, and **On**.
2. Select a value.
3. Click the arrow next to the selected value.
   - A date entry field and a small calendar icon appear.
4. Click the calendar icon, browse to a specific date, and then click the date.
   - Alternatively, in the date entry field, type a date using the format m/d/yy, and click the magnifying glass icon.
   - Avamar Client Manager refreshes the list. Only entries within the specified period appear on the list.
5. (Optional) Further refine the results by repeating these steps using the other values.

**Results**

Avamar Client Manager refreshes the list. Only entries within the specified period appear on the list.

**Using the status filter**

Use the status filter to limit a list to entries with specific statuses.

**Before you begin**

Browse to a view that includes **Status** on the **Filters** bar.

**Procedure**

1. On the **Filters** bar, click the arrow next to **Status**.
   - A selection list of all statuses for all entries in that context appears.
2. Select a status.
   - Avamar Client Manager refreshes the list. Only entries with the selected status appear on the list.
3. (Optional) Repeat the steps to select additional statuses.

**Results**

Avamar Client Manager refreshes the list. Only entries with the selected statuses appear on the list.

**Using the status code filter**

Use the status code filter to limit a list to entries with specific status codes.

**Before you begin**

Browse to a view that includes **Status Code** on the **Filters** bar.

**Procedure**

1. On the **Filters** bar, click the arrow next to **Status Code**.
   
   A selection list of the status codes for all entries in that context appears.

2. Select a status code.
   
   Avamar Client Manager refreshes the list. Only entries with the selected status code appear on the list.

3. (Optional) Repeat the steps to select additional status codes.

**Results**

Avamar Client Manager refreshes the list. Only entries with the selected status codes appear on the list.

**Using the success criteria filter**

Use the success criteria filter to define which clients Avamar Client Manager includes in a list of successful clients.

**Before you begin**

Browse to a view that includes **Success Criteria** on the **Filters** bar.

**Procedure**

1. On the **Filters** bar, click the arrow next to **Success Criteria**.
   
   A selection list appears, with the values: **At least one activity successful**, **All activities successful**, and **Last activity successful**.

2. Select a value.
   
   The value that you select determines which clients Avamar Client Manager includes in the list of successful clients. Avamar Client Manager only includes clients that match the selected activity status.

   For example, select **Last activity successful**. Avamar Client Manager refreshes the list and only includes the clients with a successful backup or restore.

**Results**

Avamar Client Manager refreshes the list. Only clients with an activity status that matches the selected value appear on the list.

**Using the version filter**

Use the version filter to limit a list to clients with specific versions of the Avamar client software.

**Before you begin**

Browse to a view that includes **Version** on the **Filters** bar.
Procedure
1. On the Filters bar, click the arrow next to Version.
   A selection list of the Avamar client software versions for all clients in that context appears.
2. Select a version.
   Avamar Client Manager refreshes the list. Only clients with the selected software version appear on the list.
3. (Optional) Repeat the steps to select additional software versions.

Results
Avamar Client Manager refreshes the list. Only clients with the selected software versions appear on the list.

Viewing details
Use the Details panel to view context relevant details.

Before you begin
Browse to a view that includes the Details panel or Details bar on the right-side.

Procedure
1. On the right-side of the page, click the Details bar.
   The Details panel expands.
2. In Summary, select an object.
   The page context determines the object type. An object can be a client or a group. You can select more than one object.
   Detailed information for the selected object appears in the Details panel.
3. (Optional) When you select more than one object, use the paging controls at the bottom of the Details panel to view information for each selected object.

Exporting data
Use export to download the selected summary as an Excel spreadsheet.

Before you begin
Browse to a page view that includes Export on the page bar.

Procedure
1. On the page bar, click Export.
   Avamar Client Manager includes all information from the summary in the exported data.
   The web server pushes an Excel file containing the summary information to the browser.
2. Save the file locally.
3. Use an application that can read the Excel-formatted spreadsheets to open the file.

Setting the entries per page limit
Increase the limit on the number of entries displayed in summary lists.

By default, Avamar Client Manager limits its summary lists to 25 entries per page. When there are more entries than the current entries per page limit, the entries appear on 2 or
more pages. You can increase the entries per page limit to make it easier to work with many entries.

**Procedure**

1. On the status bar at the bottom of Avamar Client Manager, click **Entries Per Page**.
   
   The list of choices appears.

2. Click a number on the list.

**Results**

Avamar Client Manager sets the selected number as the new limit and refreshes the page.

**Viewing tool tips**

Enable and display tool tips to view concise help messages for various elements of the UI.

**Procedure**

1. On the status bar at the bottom of Avamar Client Manager, select **Show Tooltips**.

2. Hover the pointer over a user interface element that has a tool tip.

   The following elements may have tool tips:
   
   - Dashboard chart sections
   - Controls
   - Column headings

**Overview**

The Overview page provides access to high-level information about the management of Avamar clients. It also provides tools for the administration of Avamar servers.

From the left-side menu of the Overview page, select:

- **Server Summary**
  
  Select **Server Summary** to view information about the selected Avamar server, to add an Avamar server, to remove an Avamar server, or to edit the settings for an Avamar server.

- **Dashboard**
  
  Select **Dashboard** to view information about the client backups for the selected Avamar server.

**Server Summary**

The **Server Summary** section of the Overview page provides columns of information about the Avamar servers that Avamar Client Manager manages.

Filter this information by using the filters available on the Filters bar. Change the sorting method that is used for the list by clicking a column heading.

In each of the following columns, click a nonzero value to see a more detailed report about that column’s information:

- Active Clients
- Idle Clients
- Successful Clients
Failed Clients

Server Summary columns

The following table describes the columns that are used in the Server Summary section of the Overview page.

**Table 95** Columns used in the Server Summary section

<table>
<thead>
<tr>
<th>Column</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Server</td>
<td>Hostname or IP address of the Avamar server.</td>
</tr>
<tr>
<td>Version</td>
<td>Version of Avamar server software that is installed on the Avamar server.</td>
</tr>
<tr>
<td>Total Clients</td>
<td>Total number of clients that are registered with the Avamar server. Does not include retired clients.</td>
</tr>
<tr>
<td>Active Clients</td>
<td>Total number of clients with activity (backup or restore) during the specified period.</td>
</tr>
<tr>
<td>Idle Clients</td>
<td>Total number of clients with no backup activity during the specified period.</td>
</tr>
<tr>
<td>Successful Clients</td>
<td>Total number of clients with a backup status that matches the value set in the Successful Backups filter. Also includes the average amount of time for those backups.</td>
</tr>
<tr>
<td>Failed clients</td>
<td>Total number of clients with failed backups during the specified period.</td>
</tr>
<tr>
<td>Clients with Restore</td>
<td>Total number of clients with restore activity (successful or unsuccessful) during the specified period.</td>
</tr>
</tbody>
</table>

Dashboard

The Dashboard section of the Overview page provides a graphical snapshot view of a selected server.

The dashboard provides information in panels that you can expand, collapse, or delete to create the view you need.

Usage tips:
- Collapse or expand a panel by clicking the arrow icon in the panel's title bar.
- Return the dashboard to its default view by reloading the page in your web browser.

Setting a panel's period

Set a panel's period to define the number of days of data in the display.

**Before you begin**

Browse to the Dashboard section of the Overview page, with any of the following panels displayed: Analyze, Backup Report, and Backup Trend.

**Procedure**

1. On a panel, in the period field, click the arrow icon.

   The period field is available on the following panels:
   - Analyze
   - Backup Report
   - Backup Trend
2. Select a period.

The available choices are:

- Last 24 hours
- Last 7 days
- Last 30 days

Avamar Client Manager refreshes the panel with data for the selected period.

Client panel

The **Client** panel uses a pie chart to represent the total number of potential clients for the selected server. Colors represent the percentage of the total for:

- **Activated**
  Green represents the percentage of clients that the selected server has activated.
- **Not activated**
  Red represents the percentage of clients that the selected server has registered, but not activated.
- **Free**
  Gray represents the percentage of unused client connections available on the selected server.

Server panel

The **Server** panel provides a grid view of information about the selected server.

**Table 96** Server information on the Server panel

<table>
<thead>
<tr>
<th>Column</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Node Type</td>
<td>Specifies the server’s node type: Single or Multi.</td>
</tr>
<tr>
<td>Active Backup</td>
<td>Number of running backups.</td>
</tr>
<tr>
<td>Backup in Queue</td>
<td>Number of backups in the server’s queue waiting to run.</td>
</tr>
<tr>
<td>Replication</td>
<td>Current state of the replication cron job:</td>
</tr>
<tr>
<td></td>
<td>• Running</td>
</tr>
<tr>
<td></td>
<td>• Not running</td>
</tr>
<tr>
<td>Status</td>
<td>Current state of the server’s Management Console Server (MCS) system:</td>
</tr>
<tr>
<td></td>
<td>• Active</td>
</tr>
<tr>
<td></td>
<td>• Down</td>
</tr>
</tbody>
</table>

Backup Trend panel

The **Backup Trend** panel is a line chart that shows the size of data that is backed up at specific points in time over a defined period. The x-axis represents points in time over the selected period. The y-axis represents the size of data in the backup at each point in time.

The line that is drawn between the plotted points represents the backup trend, which is the change in backed up data over time.
Client Type panel

The Client Type panel uses a bar chart to represent for the selected server the number of activated clients that are in each of the following categories:

- **Regular**
  All activated clients that do not fit into one of the other three categories.
- **vMachine**
  Guest clients. The virtual computers that are backed up through Avamar client software running on the host computer.
- **Proxy**
  Proxy virtual machine clients. Clients that use Avamar for VMware image backup and restore.
- **vCenter**
  Avamar clients that protect vCenter management infrastructure by backing up vCenter hosts.

Analyze panel

The Analyze panel uses a bar chart to represent the number of clients that are in each of the following states during the selected period:

- **Successful**
  Clients with at least one successful backup.
- **Failed**
  Clients with backup activity but no successful backups.
- **Idle**
  Clients with no backup activity.

Backup Report panel

For backups started during the selected period, the Backup Report panel uses a bar chart to represent the number of each of the following results:

- **Successful**
  Successfully completed backups, with or without errors.
- **Failed**
  Backups that failed to complete.
- **Canceled**
  Backups that are canceled before completion.

Client Queues panel

The Client Queues panel uses a bar chart to display the number of clients in each of the following queues:

- **Upgrade**
- **Move to server**
- **Activation**

Storage Capacity panel

The Storage Capacity panel uses a pie chart to represent the total storage capacity of the selected server. Colored slices represent the following:

- **Used**
  Red represents the portion of storage that contains data.
• Free Capacity
  Green represents the portion of storage that is unused and available.

Backup Health panel

The Backup Health panel uses a bar chart to represent the number of clients that have retained backup data for specific periods of time. The panel uses the periods: 1 day, 30 days, 60 days, and 90 days.

On the bar chart, the x-axis represents the period that Avamar has retained the data and the y-axis represents the number of clients.

Clients

The Clients page provides information and tools for working with Avamar clients. From this page you can:

• Select the computers in your enterprise's domain and add them as Avamar clients
• View detailed information about individual clients
• Move, retire, and delete clients
• Change a client's group associations
• Upgrade the Avamar software on the client

To navigate between the sections of the Clients page, select from the choices in the left-side menu.

Client and server tools

Avamar Client Manager provides several tools to help manage Avamar clients and Avamar servers.

A tool only appears when it is relevant to the context. Changes made by the tool apply to the selected client and the selected server. Launch a tool by clicking its command button.

Creating an Avamar domain

Create an Avamar domain to add a branch to an Avamar server's administrative hierarchy.

Before you begin

Browse to a view that includes Create Domain: either the Add New Clients dialog box or the Client Move dialog box.

Procedure

1. In the Domain Selection pane, select the location for the new domain.
   To locate the new domain directly beneath the root domain, select the server icon. To locate the new domain beneath another domain, select that domain.

2. Click Create Domain.
   The New domain dialog box appears.

3. In New Domain Name, type a name for the domain.
   Avamar does not allow the following characters in a domain name: =~!@$^%(){}[]\;/:*?<>'\&+

4. (Optional) Type information in the Contact, Phone, Email, and Location fields.
5. Click OK.

Results
Avamar Client Manager adds the new domain to the selected server and the new domain appears on the Domain Selection pane.

Viewing the group associations of a client
To determine the policies that apply to a client, view the groups that include the client.

Before you begin
Browse to a view that includes Group Associations on the Actions bar.

The group associations of a client determine the client’s backup dataset, the client’s backup schedule, and the client’s backup retention period.

Procedure
1. Select a client.
2. Click Group Associations.

Results
The Groups for Client dialog box appears and lists the client's groups.

Adding group associations to a client
To apply the policies of a group to a client, add the group association to the client.

Before you begin
Browse to a view that includes Group Associations on the Actions bar.

This task results in an association between a client and a group. The Avamar server applies the group’s policies to the client.

Procedure
1. Select a client.
2. Click Group Associations.
3. On the Groups for Client dialog box, click Add Groups.
   The Add Groups for Client dialog box appears.
4. Select a group.
   You can select more than one group.
5. Click Add.

Results
Avamar Client Manager adds the group associations to the client.

Creating a group
To make a new set of policies available for assignment to clients, create a group with the policies. The Create Group command is available when adding a client to a group, and when moving a client to a new domain or to a new server.

Before you begin
Browse to a view that includes Create Group: either the Add Groups dialog box or the Client Move dialog box.
Procedure

1. Click Create Group.
   - On the Client Move dialog box, selecting a domain enables the button.
   - The Create Group in Domain dialog box appears.

2. In Group Name, type a name for the new group.
   - Avamar does not allow any of the following characters in a group's name: =~!@#$%^(){}[]\|,;":'&+

3. (Optional) Select Enable to enable scheduled backups of clients that you assign to the group.
   - Clear this checkbox to disable scheduled backups of clients that you assign to the group.

4. In Dataset, select a dataset for the group.

5. In Schedule, select a schedule for the group.

6. In Retention Policy, select a retention policy for the group.

7. Click OK.

Results
- Avamar Client Manager creates the new group in the selected domain.

Removing group associations from a client
- To stop applying a group’s policies to a client, remove the group association from the client.

Before you begin
- Browse to a view that includes Group Associations on the Actions bar.
- This task removes the association between a client and a group. When you complete the task the group’s policies no longer apply to the client.

Procedure

1. Select a client.

2. Click Group Associations.

3. On the Groups for Client dialog box, select a group.
   - You can select more than one group.

4. Click Remove.

Results
- Avamar Client Manager removes the association between the client and the selected groups.

Overriding group policy settings for a client
- To modify policies applied to a client, override the policies of its group.

Before you begin
- Browse to a view where View/Edit Details appears on the Actions bar and the client appears in the clients list.
Procedure
1. Select a client.
2. On the Actions bar, click View/Edit Details.
   The Client Details dialog box appears.
3. Select the Advanced tab.
   The policy override settings appear with the client’s current state shown.
4. Make changes to the client’s current state by selecting or clearing settings.
5. Click OK.

Results
Avamar Client Manager changes the group policy settings for the client.

Group policy override settings
To modify a policy that is applied to a client, use one of the policy override settings.

The following table describes the policy override settings on the Advanced tab of the Client Details dialog box.

Table 97 Settings on the Advanced tab of Client Details

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Override group retention</td>
<td>Permits you to assign to a client a retention setting that is different from the group setting. After selecting this option, assign a retention setting by selecting it from the Select an existing retention policy list.</td>
</tr>
<tr>
<td>Select an existing retention policy</td>

Viewing summary information about a client

Use Client Details to see information about a client and its users.

**Before you begin**

Browse to a view where View/Edit Details appears on the Actions bar and the client appears in the clients list.

**Procedure**

1. Select a client.
2. On the Actions bar, click View/Edit Details.
   - The Client Details dialog box appears.
3. Select the Summary tab.

**Results**

Information about the client appears. Also, a list of users associated with the client appears.

Changing a client's name on the server

When you change a computer's hostname, also change the name that is used by the Avamar server to identify the computer as an Avamar client.

**Before you begin**

Change the hostname on the computer, and in DNS, before performing this task. Browse to a view where View/Edit Details appears on the Actions bar and the computer appears in the clients list.

**Procedure**

1. Select a client.
2. On the Actions bar, click View/Edit Details.
   - The Client Details dialog box appears.
3. Select the Summary tab.
4. In Client name, type the new hostname for the computer.
5. Click OK.
Avamar Client Manager replaces the old hostname with the new hostname for the Avamar client on the Avamar server.

Viewing a client's backup history

To determine whether an Avamar server has backed up a client as expected, view the client's backup history.

Before you begin

Browse to a view where View/Edit Details appears on the Actions bar and the client appears in the clients list.

Procedure

1. Select a client.
2. On the Actions bar, click View/Edit Details.
   The Client Details dialog box appears.
3. Select the Backups tab.
4. In From, select the earliest date of the period to view.
5. In To, select the latest date of the period to view.
6. (Optional) Select On-demand backups.
   Select this choice to include user-initiated backups in the results. Clear this choice to exclude those backups.
7. (Optional) Select Scheduled backups.
   Select this choice to include backups initiated by a group schedule in the results. Clear this choice to exclude those backups.

Results

A list of the client's backups that match the filter settings appears.

Viewing a client's installed plug-ins

View the Avamar plug-ins that are installed on an Avamar client to help determine the types of data in its backups.

Before you begin

Browse to a view where View/Edit Details appears on the Actions bar and the client appears in the clients list.

Procedure

1. Select a client.
2. On the Actions bar, click View/Edit Details.
   The Client Details dialog box appears.
3. Select the Plug-ins tab.

Results

The plug-ins that are installed on the client appear.
Deleting a client from a server

To remove a client's records and backups from an Avamar server, delete the client from the server.

**Before you begin**
Browse to a view where the client appears in the client list and **Delete** appears on the Actions bar.

When Avamar Client Manager deletes a client from an Avamar server it stops all activity with that client, deletes the client's backups, and removes all record of the client from the server's database.

**Procedure**
1. Select a client.
2. On the **Actions** bar, click **Delete**.
3. On the **Confirm** dialog box, type the password.
   Use the password of the account that is logged in to Avamar Client Manager.
4. Click **OK**.
   The **Alert** dialog box appears.
5. Click **OK**.

**Results**
Avamar Client Manager runs a background process that removes all the client's information and data from the server.

**Add Clients**

The **Add Clients** section provides information and tools to register and activate enterprise computers as Avamar clients.

Use the **Add Clients** section to import information about the computers in the enterprise. Import the information from a supported LDAP naming system or from a CSV file.

After import, filter the information by client status and client name to help in the selection of prospective Avamar clients.

Use Avamar Client Manager to register and activate the selected computers to an Avamar server. Completion of the activation process requires installation of the Avamar client software on the computers and access to Avamar client processes from the server. The normal workflow is to install the client software on a computer before selecting it for activation.

**Directory service information**

You can use an enterprise's directory service to provide Avamar Client Manager with information about the computers that are potential Avamar clients.

Use a supported directory service that has information about the potential Avamar client computers. Avamar Client Manager queries the directory service to obtain information about clients and, if available, directory service organizational units, such as directory domains, and directory groups.

Before using the directory service method to obtain information about computers in a domain, configure Avamar Client Manager to use the directory service.

The directory service method requires the following:
TCP/IP access to the directory service from the server that is running Avamar Client Manager.

Account information for a user account with read access to the directory service.

The name of the directory service domain for the computers that you want to import.

Importing information from a directory service

To prepare to add computers as Avamar clients, import information about the computers from the directory service.

Before you begin

Do the following:

- Configure Avamar Client Manager to use the directory service.
- Obtain a username, and its associated domain and password for an account with read access to the directory service.
- Have available the name of the directory service domain of the computers that are being imported.

Procedure

1. In the left-side menu, click Clients > Add Clients.
2. On the Actions bar, click New Clients.
   
   The Client Information Source dialog box appears.
4. In User Domain, select the domain of the account you are using to access the directory service.
   
   To add directory service domains to this list, refer to the administration guide.
5. In User Name, type the name of the account.
6. In Password, type the password of the account.
7. In Directory Domain, select the name of the directory service domain for the computer information you are importing.
8. Click OK.

Results

Avamar Client Manager imports the information from the directory service.

After you finish

Using the imported computer information, select and activate computers as clients of an Avamar server.

CSV file information

You can use a comma-separated values (CSV) file to provide Avamar Client Manager with information about the computers that are potential Avamar clients.

Create the CSV file manually or create it by using the output of a Systems management tool such as the Microsoft System Center Configuration Manager or the Microsoft Systems Management Server.

You can use the output that a Systems management tool generates during installation of the Avamar client software a group of computers to create the CSV file. However, only those clients with the Avamar client software successfully installed appear in Avamar Client Manager.
During the upload of a CSV file, Avamar Client Manager checks the file for correct formatting, and cancels the upload when it finds a problem.

**CSV file format**

A correctly formatted CSV file complies with the following rules:

- At least two rows.
- The values are separated only by a comma.
- The first row of the file must consist of the literal names for each type of value. The name for the first value is **Hostname**. The name for the second value is **Group**.
- The second row, and all subsequent rows, must have at least one value and no more than two values.
- The formatting rules require a first value that is a valid hostname for a computer and a trailing comma.
- The second value is optional, but when you include it, it must be the directory service logical group name for the computer. When you do not provide the second value for a computer, Avamar Client Manager lists the computer at the root level in the hierarchical display.
- In the second value, use a forward slash (/) to separate the hierarchical levels of the directory service logical group name.

If you use spreadsheet software to create or edit the client list, do not add a comma with the value to try to create comma separated values. Adding a comma to the value within the spreadsheet software can result in an incorrectly formatted file. When you save the client list in the editor as a CSV file type, the editor adds the comma separators as part of the file conversion process. To check the formatting, open the client list in a plain text editor.

**Example of a correctly formatted client list file**

In a plain text editor, a correctly formatted client list file looks like the following example.

<table>
<thead>
<tr>
<th>Hostname</th>
<th>Group</th>
</tr>
</thead>
<tbody>
<tr>
<td>User1-desktop.Acme.corp.com</td>
<td>acme.corp/USA/MA</td>
</tr>
<tr>
<td>User1-laptop.Acme.corp.com</td>
<td>acme.corp/USA/CA/SFO</td>
</tr>
<tr>
<td>User2-desktop.Acme.corp.com</td>
<td>acme.corp/Engineering</td>
</tr>
<tr>
<td>User3-desktop.Acme.corp.com</td>
<td></td>
</tr>
<tr>
<td>User4-desktop.Acme.corp.com</td>
<td></td>
</tr>
</tbody>
</table>

The first line lists the literal names of each type of value.

The second line contains the hostname `User1-desktop.Acme.corp.com`, the separating comma, and the group `acme.corp/USA/MA`.

The third line contains the hostname `User1-laptop.Acme.corp.com`, the separating comma, and the group `acme.corp/USA/CA/SFO`.

The fourth line contains the hostname `User2-desktop.Acme.corp.com`, the separating comma, and the group `acme.corp/Engineering`.

The fifth and sixth lines contain only the hostnames `User3-desktop.Acme.corp.com` and `User4-desktop.Acme.corp.com`, each followed by a comma. The formatting rules require a comma, even without a group. The lines do not list groups, so both hostnames appear at the root level of the hierarchical display.
Figure 14  View after uploading the example CSV file

Uploading information in a CSV file

To prepare to add computers as Avamar clients, upload information about the computers in a comma-separated values (CSV) file.

Before you begin

Generate or create a correctly formatted CSV file and have a copy available on the web browsing computer.

Procedure

1. In the left-side menu, click Clients > Add Clients.
2. On the Actions bar, click New Clients.
   The Client Information Source dialog box appears.
3. Select CSV File.
4. Click Browse.
   The Choose File to Upload dialog box appears.
5. Browse to the CSV file, select it, and click Open.
6. On the Client Information Source dialog box, click OK.

Results

Avamar Client Manager uploads the information from the CSV file.

After you finish

Using the uploaded computer information, select and activate computers as clients of an Avamar server.

Activation

Activation consists of changing the relationship between a computer and an Avamar server to enable the server to manage backups of the computer.

The relationship moves through the three states that are shown in the following table.
Table 98 Relationship states during client activation

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>No relationship</td>
<td>The computer is unknown to the server. Computers in this state appear in <strong>Add Clients</strong>, when you first add the computer information to Avamar Client Manager.</td>
</tr>
<tr>
<td>Registered</td>
<td>Avamar Client Manager added the information about the computer to the Avamar server’s database. Computers in this state appear in <strong>Registered Clients</strong> after Avamar Client Manager starts the activation process and completes registration with the Avamar server. The changed state of these computers also appears in <strong>Add Clients</strong>.</td>
</tr>
<tr>
<td>Activated</td>
<td>The computer has Avamar client software that is installed and running. The client software and the server are in communication and have exchanged an encrypted key to verify their identities. Computers in this state appear in <strong>Activated Clients</strong> after activation is complete. The changed state of these computers also appears in <strong>Add Clients</strong> and <strong>Registered Clients</strong>.</td>
</tr>
</tbody>
</table>

A computer that is in the activation process appears on the **Queues** page, in **Activation**. Avamar Client Manager tries to activate a computer every 2 hours until it succeeds or until it reaches the limit of 24 tries. When the process completes, Avamar Client Manager removes the computer from this view and adds an entry on the **Logs** page, in **Activation**.

Activating computers to enable backup management

To enable backup management of a client, activate it with an Avamar server.

**Before you begin**

Install Avamar client software on the computers being activated and import information about the computers from either a directory service or a CSV file.

**Procedure**

1. On the left-side menu, click **Clients > Add Clients**.
   A hierarchical view of the computers in the enterprise appears. Avamar Client Manager generates this view from the information that you imported.
2. Browse or search the hierarchy to find the computers to activate.
3. Select each computer to activate.
   To select all computers in a folder, expand the folder to show the computers, then select the folder.
4. Click **Activate**.
   The **Server - Domain Selection** dialog box appears.
5. Expand the listing for a server, and select an Avamar domain.
   Avamar Client Manager assigns the computers to the selected server and domain during activation.
6. Click **Next**.
   The **Server - Group Selection** dialog box appears.
7. Select a group or multiple groups.
   Avamar Client Manager assigns the computers to the selected group or groups during activation.
8. Click Finish.

Results
Avamar Client Manager sends the activation task to the queue.

After you finish
Check the Activation section of the Queues page to determine the status of the activation process. After the process completes, check the Activation section of the Logs page to determine its final status.

Registered Clients
Clients that an Avamar server has registered but not activated appear in the Registered Clients section.

Use the Registered Clients section to select clients and perform the following client-related tasks:

- Activate
- Delete
- Associate with groups
- View and edit details
- Add and remove group override settings

Activating a registered client
To enable backup management of a registered client that failed to activate when it was registered, activate it from the Registered Clients section.

Before you begin
Install the Avamar client software on the computers you want to activate.

When activation of a computer as a client of an Avamar server fails, Avamar Client Manager still registers the computer with the server. Correct any problems that prevented the activation. Then retry the activation of the registered client.

Procedure
1. On the left-side menu, click Clients > Registered Clients.
2. Select each client to activate.
3. Click Activate.

Results
Avamar Client Manager sends the activation task to the queue.

After you finish
Check the Activation section of the Queues page to determine the status of the activation process. After the process completes, check the Activation section of the Logs page to determine its final status.

Activated Clients
Clients that are activated with the selected Avamar server appear in the Activated Clients section.

Use the Activated Clients section to perform the following tasks:
Moving a client to a different server

Move client to a different server
Move client to a different Avamar domain
Retire a client
Delete a client
Manage a client’s group associations
View and edit a client’s details
Add and remove group override settings

Moving a client to a new server

To manage an Avamar client through a new Avamar server, move the Avamar client's registration, activation, and backups to the new server.

Before you begin

Do the following:

- Add the target server to Avamar Client Manager as described in Adding an Avamar server on page 276.
- Select a client that is activated to a server with Avamar server software version 5.0.1.31 or newer.
- For a client activated with an Avamar server older than version 6.x, fully initialize the MCS process on that server.

Procedure

1. On the left-side menu, click Clients > Activated Clients.
2. Select a client.
   Do not select an NDMP client. Do not select a client that has backups on a Data Domain server.
3. On the Actions bar, click Move.
   The Domain Selection pane of the Client Move dialog box appears.
4. At the top of the Domain Selection pane, from the server selection list, select the Avamar server that is the target of the move.
   The target server’s domains appear in the Domain Selection pane.
5. In the Domain Selection pane, select the target domain.
6. Click Next.
   The Group Selection pane of the Client Move dialog box appears.
7. Select a target group.
   You can optionally select more than one target group. Avamar Client Manager adds the client to all selected groups.
8. In Replicate Existing Backups at the bottom of the Group Selection pane, select a value.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>All</td>
<td>Replicate all the client's backups to the target server.</td>
</tr>
<tr>
<td>Last</td>
<td>Replicate only the last backup.</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>--------</td>
<td>-------------</td>
</tr>
<tr>
<td>None</td>
<td>Replicate none of the backups.</td>
</tr>
</tbody>
</table>

Replication makes the backups available from the target server.

9. (Optional) In **Delete From Source**:
   - Select to remove all the client’s backups from the source server.
   - Clear to move the source server's registration of the client to the source server’s MC_RETIRED domain and retain copies of the client’s backups on the source server.

10. Click **Finish**.

   The **Confirm Replication Authentication** dialog box appears.

11. In **Source Server**, type the password for the repluser account on the source server.

12. In **Target Server**, type the password for the repluser account on the target server.

13. Click **OK**.

**Results**

In a background process, Avamar Client Manager moves the client to the selected target.

---

**Moving a client to a different Avamar domain**

To change the administrative relationship between an Avamar client and an Avamar server you can move the client to a different Avamar domain.

**Before you begin**

Select a client that is activated to a server with Avamar server software version 6.x or newer.

**Procedure**

1. On the left-side menu, click **Clients** > **Activated Clients**.
2. Select a client.
3. On the **Actions** bar, click **Move**.
   
   The **Client Move** dialog box appears.
4. In the **Domain Selection** pane of the **Client Move** dialog box, select the target domain.
5. Click **Next**.
   
   The **Group Selection** pane appears on the **Client Move** dialog box.
6. Select a target group.
   
   You can optionally select more than one target group. Avamar Client Manager adds the client to all the selected groups.
7. Click **Finish**.
   
   An alert box appears.
8. Click **OK**.

**Results**

In a background process, Avamar Client Manager moves the client to the selected target.
Retiring a client

To stop backups of an Avamar client, retire the Avamar client. Avamar Client Manager retains backups that exist at the time of retirement so that you can restore data when necessary.

Procedure

1. On the left-side menu, click Clients > Activated Clients.
2. Select a client.
   
   You can select more than one client. The retention policy setting you select applies to all selected clients.
3. On the Actions bar, click Retire.
   
   The Retire Client dialog box appears.
4. In Select Retention Policy, select one of the options.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Retire client and retain backups with existing expiration date</td>
<td>The Avamar server retains the backups for the existing retention period</td>
</tr>
<tr>
<td>Retire client and retain all backups indefinitely</td>
<td>The Avamar server retains the backups until you manually delete them</td>
</tr>
<tr>
<td>Retire client and reset backup expiration date</td>
<td>The Avamar server retains the backups until the date set in New Expiration Date</td>
</tr>
</tbody>
</table>

5. If you select Retire client and reset backup expiration date in the previous step then, in New Expiration Date, select a date.

   The Confirm dialog box appears.
6. Click Yes.

   The Alert dialog box appears.
7. Click OK.

Results

In a background process, Avamar Client Manager retires the selected client.

Failed Clients

Clients that have unsuccessful backup or restore activity appear in the Failed Clients section.

Use the Failed Clients section to perform the following tasks:

- Delete a client
- Manage a client’s group associations
- View and edit a client’s details
- Add and remove group override settings

When working with failed clients, use the filters that are described in the following table.
Table 99 Failed client filters

<table>
<thead>
<tr>
<th>Filter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Period</td>
<td>Specifies the period that Avamar Client Manager examines.</td>
</tr>
<tr>
<td>Activity Type</td>
<td>Specifies the type of activity that Avamar Client Manager examines.</td>
</tr>
<tr>
<td>Failure Criteria</td>
<td>Defines the failure threshold that is used by Avamar Client Manager.</td>
</tr>
</tbody>
</table>

Idle Clients

Activated Avamar clients, that do not have activity during a specified period, appear in the Idle Clients section.

When working with idle clients, use the Period filter to specify the period that Avamar Client Manager examines for activity, and the Activity Type filter to specify the type of activity.

Use the Idle Clients section to perform the following tasks:
- Delete a client
- Manage a client's group associations
- View and edit a client's details
- Add and remove group override settings

Upgrade Clients

The Upgrade Clients section provides information and tools you can use to apply upgrades and hot fixes to Avamar clients.

Use the Upgrade Clients section to perform the following tasks:
- Download an upgrade package to a server
- Select an upgrade package
- Apply the package to selected clients
- Remove an upgrade package from a server

Upgrade Clients section requirements

Before using the Avamar Client Manager Upgrade Clients section, do the following:
- For each client or plug-in, install the minimum client version that is listed in the EMC Avamar Push Client upgrade compatibility table of the EMC Avamar Compatibility and Interoperability Matrix. Obtain the latest version of this document from EMC Online Support (https://support.emc.com).

Note

Use of the Upgrade Clients feature to upgrade Avamar client software on Windows cluster nodes is not supported. The EMC Avamar for Windows Server User Guide describes how to upgrade Avamar client software on Windows cluster nodes.
- Install, configure, and run the Avamar Downloader Service. The Avamar Downloader Service obtains the client packages and plug-in packages that are required by the upgrade feature. This service pulls the packages from EMC and pushes them onto the Avamar data server subsystem (GSAN). After the packages are updated in GSAN, the
packages appear in the Avamar Client Manager Select Package window, and upgrades can be performed.

Multiple system deployments

For Avamar deployments that include more than one Avamar system, Avamar Client Manager running on one of the Avamar systems (managing system) can be used to manage clients that are associated with other Avamar systems (managed systems).

The managed systems must meet the following requirements:

- Managed system is added to Avamar Client Manager on the managing system. Adding managed systems to Avamar Client Manager on the managing system provides the managing system with the information that it requires to support client upgrades on the managed systems.
- Managed system is running a "near version" of Avamar software that is no more than two versions earlier than the managing system.

The near version requirement ensures that all packages required by clients on the managed systems are available for deployment through the managing system.

To provide full client upgrade support for clients that are associated with Avamar systems that do not meet the near version requirement, run Avamar Client Manager on those systems.

Downloading upgrade and hotfix packages

Use Avamar Client Manager to download upgrade and hotfix packages to an Avamar server.

Before you begin

Do the following:

- Install and configure the Avamar Downloader Service and the AvInstaller service. Refer to the administration guide for information about these tasks.
- Select an Avamar server.

Before applying an upgrade or hotfix package to an Avamar client, download the package to the Avamar server associated with the Avamar client.

Procedure

1. On the left-side menu, click Clients > Upgrade Clients.
2. On the Actions bar, click Select Package.
   
   The Upgrade Client dialog box appears.
3. In the Status column for the package, click Download.
   
   The status of the package must be Available.

Results

Avamar Client Manager begins the download. A progress bar appears. After the download finishes, Avamar Client Manager updates the package status, in sequence, to each of the following values: Waiting, Processing, and Ready.

Selecting an upgrade package

Select an upgrade package or hotfix package to apply to Avamar clients.

Before you begin

Do the following:
- Install and configure the Avamar Downloader Service and the AvInstaller service. Refer to the administration guide for information about these tasks.
- Select an Avamar server.
- Download the upgrade or hotfix package to the selected Avamar server.

**Procedure**
1. On the left-side menu, click Clients > Upgrade Clients.
2. On the Actions bar, click Select Package.
   The Upgrade Client dialog box appears.
3. Select a package.
   Before you can select a package, the package must have a Ready status.
4. Click Select.
   The Upgrade Client dialog box closes.

**Results**
The Avamar clients that are eligible for the upgrade or the hotfix appear.

**After you finish**
Select clients and apply the upgrade or hotfix package to them.

### Applying the upgrade package
Select Avamar clients and apply the upgrade package or the hotfix package.

**Before you begin**
Select an upgrade package or a hotfix package. View the list of Avamar clients that are eligible for the selected package.

**NOTICE**
Applying an upgrade to an Avamar NDMP Accelerator node (accelerator node) causes the accelerator node to drop running backups. After the upgrade, the accelerator node starts and completes NDMP backups normally.

**Procedure**
1. From the list of Avamar clients that are eligible for the upgrade or the hotfix, select a client.
   You can select more than one client.
2. On the Actions bar, click Upgrade.

**Results**
Avamar Client Manager starts upgrading the selected clients. The upgrade runs in the background.

**After you finish**
Track the progress of the upgrade in the Upgrade section of the Queues page. View the final status of the upgrade in the Upgrade section of the Logs page.
Deleting upgrade and hotfix packages

Use Avamar Client Manager to delete upgrade and hotfix packages from an Avamar server.

Before you begin
Select an Avamar server that has an unneeded upgrade or hotfix package.

Procedure
1. On the left-side menu, click Clients > Upgrade Clients.
2. On the Actions bar, click Select Package.
   The Upgrade Client dialog box appears.
3. Select a package.
   You can only delete packages that have a Ready status.
4. Click Delete.

Results
Avamar Client Manager removes the selected package from the Avamar server.

Policies

The Policies page provides access to group policy tasks and information.
The Policies page includes a summary of each group policy on the selected Avamar server.

Use the Policies page to perform the following tasks:
- Add clients to a group
- Remove clients from a group
- View the details of a group’s dataset policy, retention policy, and schedule policy

Adding clients to a group

To apply the policies of a group to selected clients, add the clients to the group.
Completion of this task results in association between the selected clients and a group.
The Avamar server then applies the group’s policies to the selected clients.

Procedure
1. Click Policies > Groups.
2. Select a group.
3. Click Edit Group Members.
   The Edit Group Members dialog box appears.
4. Click Add.
   The Add Clients to Group dialog box appears.
5. Select a client.
   You can select more than one client.
6. Click Add.
Removing clients from a group

To remove the policies of a group from selected clients, remove the clients from the group.

This task removes the association between selected clients and a group. When you complete the task, the group’s policies no longer apply to the selected clients.

**Procedure**

1. Click **Policies > Groups**.
2. Select a group.
3. Click **Edit Group Members**.
   - The **Edit Group Members** dialog box appears.
4. Select a client.
   - You can select more than one client.
5. Click **Remove**.

**Results**

Avamar Client Manager removes the clients from the group.

Viewing the dataset policy of a group

Use the entry for a group on the Policies page to view details of the dataset policy of the group.

**Procedure**

1. Select an Avamar server.
2. Click **Policies > Groups**.
   - A summary view of the groups on the selected server appears.
3. On the entry for a group, in the **Dataset** column, click the name of the dataset policy.

**Results**

The dataset policy details for the selected group appear in a dialog box.

Viewing the retention policy of a group

Use the entry for a group on the Policies page to view details of the retention policy of the group.

**Procedure**

1. Select an Avamar server.
2. Click **Policies > Groups**.
   - A summary view of the groups on the selected server appears.
3. On the entry for a group, in the **Retention** column, click the name of the retention policy.
Results
The retention policy details for the selected group appear in a dialog box.

Viewing the schedule policy of a group

Use the entry for a group on the Policies page to view details of the schedule policy of the group.

Procedure
1. Select an Avamar server.
2. Click Policies > Groups.
   A summary view of the groups on the selected server appears.
3. On the entry for a group, in the Schedule column, click the name of the schedule policy.

Results
The schedule policy details for the selected group appear in a dialog box.

Queues

The Queues page provides access to the Avamar Client Manager activity queues.

The Queues page provides a summary view of active and pending Avamar Client Manager tasks for the selected Avamar server. Tasks appear in separate sections that are based on the type of task.

Table 100 Task types on the Queues page

<table>
<thead>
<tr>
<th>Type of task</th>
<th>Browse path</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Activation</td>
<td>Queues &gt; Activation</td>
<td>View active and pending tasks that are related to client activation.</td>
</tr>
<tr>
<td>Delete</td>
<td>Queues &gt; Delete</td>
<td>View active and pending tasks that are related to the removal of clients from Avamar servers.</td>
</tr>
<tr>
<td>Move</td>
<td>Queues &gt; Move</td>
<td>View active and pending tasks that are related to moving clients from one Avamar server to another</td>
</tr>
<tr>
<td>Retire</td>
<td>Queues &gt; Retire</td>
<td>View active and pending tasks that are related to retiring Avamar clients.</td>
</tr>
<tr>
<td>Upgrade</td>
<td>Queues &gt; Upgrade</td>
<td>View active and pending tasks that are related to upgrading the software on Avamar clients.</td>
</tr>
</tbody>
</table>

Use the Queues page to perform the following tasks:

- View the details of active and pending tasks
- Cancel tasks

Canceling a task

Cancel a pending task to prevent it from running.

You can stop a task from running by canceling it while it is in the pending state.
Procedure
1. On the left-side menu, click Queues > task_queue, where task_queue is the Queues page section for the type of task you are canceling.
   
   For example to cancel a client activation, click Queues > Activation.
2. Select a task.
3. Click Cancel.
   
   A confirmation dialog box appears.
4. Click OK.

Results
Avamar Client Manager removes the task from the queue, cancels the task, and adds an entry to the log.

Logs

The Logs page provides access to the Avamar Client Manager logs.

The Logs page provides a summary view of Avamar Client Manager logs. Log entries appear in separate sections that are based on the type of task that generated the entry.

Table 101 Task types on the Logs page

<table>
<thead>
<tr>
<th>Task type</th>
<th>Browse path</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Activation</td>
<td>Logs &gt; Activation</td>
<td>View log entries that are related to client activation.</td>
</tr>
<tr>
<td>Delete</td>
<td>Logs &gt; Delete</td>
<td>View log entries that are related to the removal of clients from Avamar servers.</td>
</tr>
<tr>
<td>Move</td>
<td>Logs &gt; Move</td>
<td>View log entries that are related to moving clients from one Avamar server to another.</td>
</tr>
<tr>
<td>Retire</td>
<td>Logs &gt; Retire</td>
<td>View log entries that are related to retiring Avamar clients.</td>
</tr>
<tr>
<td>Upgrade</td>
<td>Logs &gt; Upgrade</td>
<td>View log entries that are related to upgrading the software on Avamar clients.</td>
</tr>
</tbody>
</table>

- Activation
  Click Logs > Activation to view log entries that are related to client activation.
- Delete
  Click Logs > Delete to view log entries that are related to the removal of clients from Avamar servers.
- Move
  Click Logs > Move to view log entries that are related to moving clients from one Avamar server to another.
- Retire
  Click Logs > Retire to view log entries that are related to retiring Avamar clients.
- Upgrade
  Click Logs > Upgrade to view log entries that are related to upgrading the software on Avamar clients.

Use the Logs page to perform the following tasks:
• View log entries
• View the client log for upgrades
• Clear all log entries in a section

Viewing the client log after upgrading an Avamar client

View the Avamar client’s local log after a completed upgrade try.

Before you begin
Use Avamar Client Manager to apply an upgrade package or hotfix to an Avamar client.
Viewing the Avamar client’s local log can provide details about the reasons for an unsuccessful client upgrade.

Procedure
1. On the left-side menu, click Logs > Upgrade.
2. On the right-side of the page, click the Details bar.
   The Details panel expands.
3. In Summary, select a client upgrade log entry.
   Detailed information for the selected log entry appears in the Details panel.
4. On the Details panel, in Log, click View Log.

Results
The Upgrade Log window opens and the client's local log appears in the window.

After you finish
(Optional) Select and copy information from the client's local log. Paste the copied information into a text editor.

Clearing all log entries in a section

Avamar Client Manager provides a method for you to remove all log entries from a task section of Logs.

Before you begin
Complete at least one task that results in a log entry in one of the task sections of the Logs page.

Procedure
1. On the left-side menu, click Logs > task_log, where task_log is a Logs page section.
   For example, to clear all upgrade entries, click Logs > Upgrade.
2. Click Clear All.
   The Alert dialog box appears.
3. Click Yes.

Results
Avamar Client Manager removes all log entries for the selected section.
CHAPTER 13

Avamar Desktop/Laptop

This chapter includes the following topics:

- Overview of Avamar Desktop/Laptop ................................................................. 314
- Requirements for Avamar Desktop/Laptop ......................................................... 315
- Avamar client software installation .................................................................. 317
- Avamar Desktop/Laptop user authentication .................................................... 321
- Avamar Desktop/Laptop user interfaces ............................................................ 325
- Backup with Avamar Desktop/Laptop ............................................................... 331
- Restore with Avamar Desktop/Laptop ............................................................... 337
- Client backup and restore activity history ......................................................... 340
- Editing Avamar Desktop/Laptop parameters .................................................... 341
- Client log locations .......................................................................................... 342
Overview of Avamar Desktop/Laptop

Avamar Desktop/Laptop is a version of the Avamar client software for Windows and Macintosh that adds enhanced features for enterprise desktop and laptop computers. Many Avamar Desktop/Laptop features are also available on supported Linux computers.

Client installation and management
In a corporate environment, you can push install Avamar Desktop/Laptop on Windows and Macintosh desktop and laptop computers by using systems management tools such as Microsoft Systems Management Server 2003 (SMS).

You can also install the Avamar Desktop/Laptop software locally by launching an installation wizard.

After client installation, you can activate, upgrade, analyze, and manage clients by using the Avamar Client Manager web browser UI.

User authentication
Avamar Client Manager users authenticate through the enterprise Active Directory or OpenLDAP-compliant directory service, with or without Kerberos encryption. Users can also authenticate by using built-in Avamar authentication, or a combination of Avamar authentication and LDAP authentication. NIS authentication is also supported.

Pass-through authentication enables users to access the web UI without using the login screen. A secure message mechanism authenticates users based on information from the client computer. Pass-through authentication also enables administrators to allow non-domain users to restore files to their local account on the computer.

User interfaces
Avamar Desktop/Laptop functionality is available through two user interfaces:

- The client local user interface (client UI) is installed on the client computer when you install either the Avamar Client for Windows or the Avamar Client for Mac OS X. With the client UI, an Avamar icon appears in the notification area ("system tray") on Windows computers or on the menu bar on Mac computers. Right-click the icon on Windows or click the icon on Mac to open the client menu, which provides access to backup, restore, program settings, and logs.

- Use the web browser user interface (web UI) to start an on-demand backup or restore, view backup and restore activity for a client computer, or configure other backup settings for a client computer.

Backup
Users can start an on-demand backup with a single click on the client menu, or open the web UI for an interactive on-demand backup. Options to customize on-demand backup behavior include:

- Allowing users to create on-demand backup sets.
- Limiting the total number of backups that can occur each day for each client computer.
- Changing the retention policy for on-demand backups.
- Disabling on-demand backups.

You should perform scheduled backups of all Avamar Desktop/Laptop clients. For daily scheduled backups, you can allow users to select a different start time for their backups from a list of available times that you create. The system runs the backup as soon as possible after the selected time.
You can also allow users to add folders to the source data defined by the groups to which a client belongs. The folders are included in both on-demand and scheduled backups for the client.

**Restore**

Users can search for or browse to folders, files, and file versions to either the original location or to a new location on the same computer. Users can restore data with the same name or a new name.

When users restore data to the original location with the same name, the restore process overwrites any current local file versions with the restored files. This type of restore is useful in situations where the current local versions contain errors or have data corruption issues.

To avoid overwriting the current local file versions, users can restore to a new location, restore with a new name, or both.

Domain users can restore files from any Windows or Mac computer on which they have a user profile to the Windows or Mac computer to which they are logged in.

If large restore tasks are impacting network performance, you can specify a limit for the amount of data that users are allowed to restore.

Users are allowed to initiate only one restore task at a time. Additional requests are blocked and a message appears to the user. You can change this behavior to allow users to start multiple restore tasks.

**Activity history**

The History page in the web UI provides a 14-day history of the status of restore and backup tasks for a client computer, as well as listings of the folders and files backed up during that period. If you are a domain user with a user profile on the source computer, then you can view the activity history for the source computer from a different computer.

---

**Requirements for Avamar Desktop/Laptop**

You should work with an EMC field sales representatives when deciding on the characteristics of the Avamar system deployment that work best to support desktop and laptop clients for an enterprise. The environment must meet the requirements in the following topics.

Due to the wide range of differences in desktop and laptop topology for each enterprise, a description of the requirements for an Avamar system to support desktops and laptops at any one enterprise is beyond the scope of this guide.

**Client computer requirements**

Avamar client computers with Avamar Desktop/Laptop must meet the minimum requirements in the following sections.

**Operating system requirements**

Avamar Desktop/Laptop client computers require a Windows, Mac, or Linux operating system that is supported for use with the Avamar client. The *EMC Avamar Compatibility and Interoperability Matrix* on EMC Online Support provides a complete and updated list.

Windows Server, Mac OS X Server, and Linux computers that meet the requirements that are specified in the *EMC Avamar Backup Clients User Guide* are supported as server-class clients. Generally, the Avamar Desktop/Laptop enhancements function the same for server-class computers as for desktop and laptop computers. Differences include:
On a server-class computer, clicking **Back Up Now** on the **Client** menu or on the **Backup** reminder launches a backup of the dataset that is assigned individually to the computer, instead of the dataset that is assigned to a group.

To view or edit the dataset that is assigned to a server-class computer use Avamar Administrator to edit the policy settings for the client. **Overriding group policy settings for a client on page 111** provides instructions.

- The Avamar Desktop/Laptop feature for disabling backups for computers running on battery power is not available for server-class computers.
  - Backups are always enabled on server-class computers.

- After disabling locally started restores on Windows server-class computers and Macintosh server-class computers, a restore can only be performed by using Avamar Administrator.
  - However, users with local administrative rights on the server-class computer can restore backups to a different computer.

**Hardware requirements**
The following table lists hardware requirements for Avamar Desktop/Laptop client computers.

**Table 102 Avamar Desktop/Laptop hardware requirements**

<table>
<thead>
<tr>
<th>Category</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>CPU</td>
<td>1 GHz</td>
</tr>
<tr>
<td>RAM</td>
<td>1 GB</td>
</tr>
<tr>
<td>Hard drive space</td>
<td>250 MB minimum hard drive space for software installation.</td>
</tr>
<tr>
<td></td>
<td>Snapshot technology and system state backup may require additional space.</td>
</tr>
<tr>
<td>Network interface</td>
<td>Either of the following:</td>
</tr>
<tr>
<td></td>
<td>• 10BaseT or higher, configured with the latest drivers for the platform</td>
</tr>
<tr>
<td></td>
<td>• IEEE 802.11a/b/g, configured with the latest drivers for the platform</td>
</tr>
</tbody>
</table>

**Supported Avamar plug-ins**
Avamar Desktop/Laptop supports backup and restore with the following Avamar File System plug-ins:

- Windows
- Mac
- Linux

Avamar Desktop/Laptop does not support application plug-ins or file system plug-ins for other operating systems.

**Port requirements**
The TCP data port must allow bi-directional communication with the Avamar server.

**Web browser requirements**
The web browser that you use for the Avamar Desktop/Laptop user interface must be JavaScript-enabled and meet other requirements.

The following table lists supported web browsers.
Table 103 Supported web browsers for Avamar Desktop/Laptop

<table>
<thead>
<tr>
<th>Operating system</th>
<th>Supported web browsers</th>
</tr>
</thead>
<tbody>
<tr>
<td>Windows</td>
<td>• Windows Internet Explorer</td>
</tr>
<tr>
<td></td>
<td>• Mozilla Firefox</td>
</tr>
<tr>
<td></td>
<td>• Google Chrome</td>
</tr>
<tr>
<td>Macintosh</td>
<td>Apple Safari</td>
</tr>
<tr>
<td>Linux</td>
<td>Mozilla Firefox</td>
</tr>
</tbody>
</table>

Use one of the environment variables in the following table to launch the web browser.

Table 104 Environment variables for launching a web browser in Avamar Desktop/Laptop

<table>
<thead>
<tr>
<th>Browser</th>
<th>Environment variable</th>

<tr>
<td>GNOME</td>
<td>gnome-open</td>
</tr>
<tr>
<td>Others</td>
<td>BROWSER</td>
</tr>
</tbody>
</table>

Network requirements

The network in an Avamar Desktop/Laptop environment must meet the requirements in the following table.

Table 105 Avamar Desktop/Laptop network requirements

<table>
<thead>
<tr>
<th>Category</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>Protocol</td>
<td>TCP/IP.</td>
</tr>
<tr>
<td>Routers</td>
<td>Must permit TCP packet routing between the Avamar server and each client computer.</td>
</tr>
<tr>
<td>Firewalls</td>
<td>Must allow bidirectional communication between the Avamar server and each client computer using TCP data port 28002.</td>
</tr>
<tr>
<td>Naming system</td>
<td>Must facilitate connections between each client and the Avamar server, including situations where IP address changes are caused by DHCP and VPN access.</td>
</tr>
</tbody>
</table>

Avamar client software installation

The recommended method to install the Avamar client software on large numbers of Windows or Mac computers is to use a systems management tool. A systems management tool can remotely push install the software on large numbers of computers in a short amount of time.

Also, a systems management tool can often generate a list of the computers where the software is successfully installed. You can use this list in Avamar Client Manager to register and activate computers.
You can install the Avamar Client for Windows by using several silent install options.

**NOTICE**

Do not rename client installation packages. The Avamar push upgrade mechanisms are incompatible with renamed packages.

### Supported systems management tools

Remote installation has been tested and approved using the following systems management tools:

- Microsoft Systems Management Server 2003 (SMS) on Windows computers
- SMS with Quest Software’s Quest Management Xtensions for SMS on Macintosh computers

You may also be able to use other systems management tools, such as the tools in the following list, to remotely push install the Avamar client software:

- Microsoft System Center Configuration Manager 2007
- IBM Tivoli Management Framework
- HP OpenView ServiceCenter
- Symantec Altiris
- Apple Remote Desktop

Systems management tools vary. The steps required to push software to a set of computers depend on the tool. Consult the documentation for the tool to determine the steps required to perform these tasks.

### Push installation on Windows computers

**Procedure**

1. Copy the installer package for the Avamar Client for Windows to a location that is accessible to the systems management tool.
2. Configure the systems management tool to copy the correct installer package to each computer.
3. Designate the computers on which to install the software.
4. Provide an installation launch command that uses the following format:

   ```
   msiexec /qn /I "path_to_MSI_pkg" SERVER=server DOMAIN=domain GROUP="groups" UICOMPONENT={0|1} PROGRESSBAR={true|false} BALLOONMESSAGE={true|false} BACKUPREMINDER=days
   ```

The following table provides details on the arguments for the installation launch command.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;path_to_MSI_pkg&quot;</td>
<td>Specifies the full path to the location of the installer package relative to the root of the computer file system.</td>
</tr>
<tr>
<td>SERVER=server</td>
<td>Specifies the IP address or FQDN of the Avamar server that is assigned to the client. When this argument is omitted or</td>
</tr>
</tbody>
</table>
Table 106 Push install launch command arguments (continued)

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DOMAIN=domain</td>
<td>Specifies the Avamar domain for the client. The path must start with a slash path character (Unicode \u002F: <code>/</code>). The default value is <code>/clients</code>.</td>
</tr>
<tr>
<td>GROUP=groups</td>
<td>Specifies a comma-separated list of Avamar backup groups for the client. Start the path for each group with a slash path character (Unicode \u002F: <code>/</code>), and enclose the group path in quotation marks. For example: GROUP=&quot;/clients/text, /clients/admin&quot;. The default value is &quot;/Default Group&quot;.</td>
</tr>
<tr>
<td>UICOMPONENT={0</td>
<td>1}</td>
</tr>
<tr>
<td>PROGRESSBAR={true</td>
<td>false}</td>
</tr>
<tr>
<td>BALLOONMESSAGE={true</td>
<td>false}</td>
</tr>
<tr>
<td>BACKUPREMINDER=days</td>
<td>Specifies the number of days after the last backup before a backup reminder appears. The possible values for days are numbers 1 through 7 and Never. The default value is 3.</td>
</tr>
</tbody>
</table>

Users can change the values set by the UICOMPONENT, PROGRESSBAR, BALLOONMESSAGE, and BACKUPREMINDER by using options on the client menu in the client UI. You can also change the values during an upgrade.

5. Launch the systems management tool installation process.

**Push installation on Macintosh computers**

**Procedure**

1. Copy the installer package for the Avamar Client for Mac OS X to a location that is accessible to the systems management tool.
2. Configure the systems management tool to copy the correct installer package to each computer.
3. Designate the computers on which to install the software.
4. Provide the installation launch command:
   
   ```bash
   /usr/sbin/installer -pkg "path_to_install_pkg" -target install_location
   ```
   
   where `path_to_install_pkg` is the full path to the location of the installer package relative to the root of the computer file system, and `install_location` is the location in which to install the software. Normally, `install_location` is the root (`/`), but any local volume is allowed.
5. Launch the systems management tool installation process.

**After you finish**

After installation of the Avamar Client for Mac OS X, a restart of some clients may be required. This is caused by a change to the process data size setting that is made on those computers. During installation, the installer determines if the process data size is less than 96 MB. A minimum process data size of 96 MB is required for optimal performance of the Avamar Client for Mac OS X.

If the process data size is less than 96 MB, then the installer changes it to 96 MB and displays a restart reminder. If you leave the message open for more than 30 seconds without clicking a button to restart immediately or at a later time, then the reminder is hidden and appears again in 2 hours.

If you choose to restart the computer but the restart process is interrupted, then the reminder does not appear again. You must remember to restart the computer to complete the process data size change.

**Local client installation**

You can install the Avamar Desktop/Laptop software locally by launching a graphical installation interface. After the installation, the computer is ready to register and activate with an Avamar server.

To perform a local installation, you can download the client installer by using the downloads link. If the downloads link is disabled, you must transfer the client installer to the computer by some other file transfer method.

The disadvantages of using local installation are:

- It is very time consuming when performed individually on thousands of computers.
- It does not provide a list that you can use to register and activate groups of computers in Avamar Client Manager.

The *EMC Avamar Backup Clients User Guide* provides more information on local installation, upgrade, and uninstall of Avamar Desktop/Laptop.

**Avamar client software uninstall**

When you uninstall Avamar client software from a client computer, scheduled backups no longer occur for the client. You cannot restore backups to the client after you uninstall the software.

When you uninstall the Avamar client software, you can keep or delete the backups for the client:

- To keep the backups for the client so that you can restore the backups to a different client, retire the client by using Avamar Administrator.
- To delete the backups for the client, delete the client by using Avamar Administrator.

Retire or delete the client either before or after you uninstall the Avamar client software.

**Uninstall on Windows**

**Procedure**

1. Open the Windows *Add or Remove Programs* or *Programs and Features* applet.
2. In the list of currently installed programs, select *EMC Avamar for Windows*.
3. Click *Remove*.

A confirmation message appears.
4. Click Yes.

Uninstall on Macintosh

Procedure
1. Open a Terminal (shell) session.
2. Log in as an administrator.
   The uninstall command requires root (super-user) permissions. The `sudo` command is used to run the command with root permissions. An administrator account or another account listed in `sudoers` is required by `sudo`.
3. Run the uninstall script by typing the following command:
   
   ```
   sudo /usr/local/avamar/bin/avuninstall.sh
   ```

Avamar Desktop/Laptop user authentication

Avamar Desktop/Laptop protects backup data by authenticating users and enforcing access rights. Avamar Desktop/Laptop uses a separate server process running on the Avamar system to facilitate authentication through both internal and external methods. Every Avamar system installation includes the Avamar Desktop/Laptop server process.

Pass-through authentication

Pass-through authentication uses encrypted channels to access user credentials from a client computer and associate the credentials with file ownership properties. The client computer operating system obtains the user credentials during login to the computer or through common access card (CAC) technology.

Avamar Desktop/Laptop performs pass-through authentication transparently. Users can back up and restore files without viewing the Avamar Desktop/Laptop login screen.

Avamar Desktop/Laptop enables pass-through authentication by default. It is limited to users on Windows computers and Mac computers. Also, Windows users with local administrator privileges can restore files that are owned by anyone on the computer without additional login.

Pass-through authentication is supported with LDAP authentication, NIS authentication, and Avamar authentication. With Avamar authentication, Avamar Desktop/Laptop determines if the client computer is in one of the specified Avamar domains. It authenticates users of those computers through Avamar authentication. It authenticates other users through pass-through authentication.

Enabling local user access for pass-through authentication

You can configure Avamar Desktop/Laptop to allow local user access through pass-through authentication. A local user is a user that is authenticated through a local computer account instead of a domain account.

With local user access enabled, local users can access the Avamar client web UI to restore data they own on the authenticating computer.

Local user access requires pass-through authentication on a Windows computer or a Mac computer. By default local user access is disabled.
Enabling local user access applies to all clients and backups associated with the server. Before you enable local user access, carefully consider its security implications within the context of the organization. Local user authentication is inherently less secure than domain authentication.

To enable local user access for pass-through authentication, uncomment the `allowLocalUsers` property in the `dtlt.properties` file on the Avamar server, and then set its value to `true` by changing `#allowLocalUsers=false` to `allowLocalUsers=true`.

Disabling pass-through authentication

You can disable pass-through authentication and require that all users log in through the Avamar Desktop/Laptop login screen. When pass-through authentication is disabled, configure one of other methods of authentication for Windows users and Mac users.

To disable pass-through authentication, set the value of the `userLoginRequired` property in the `dtlt.properties` file on the Avamar server to `true`.

LDAP authentication

Configure Avamar Desktop/Laptop to use a supported LDAP directory service to authenticate users by using the directory service user names and passwords.

The authentication process uses Kerberos in a Simple Authentication and Security Layer (SASL) Bind by default. Alternatively, configure the authentication process to use plaintext in a Simple Bind. Only SASL Bind is supported with pass-through authentication. Plaintext Simple Bind is not compatible with pass-through authentication.

With LDAP authentication, users log in to the client computer with a domain account authenticated through a domain directory service. To use a local account, enable local user access.

To increase the security of user data, Avamar Desktop/Laptop obtains the domain username of a Windows user or Mac user from the client computer and displays it in a read-only field on the Avamar Desktop/Laptop login screen.

**Note**

Do not use the root account on a Mac to restore files from backups.

Configuring LDAP authentication for Avamar Desktop/Laptop

To configure Avamar Desktop/Laptop to authenticate users through a supported LDAP directory service, with either Kerberos in an SASL Bind or plaintext in a Simple Bind, edit the LDAP configuration file.

**Before you begin**

- Configure Avamar with information about the directory service. *Adding information for a supported LDAP directory service on page 66* provides instructions.
- Ensure that the configuration of the Avamar Desktop/Laptop server correctly describes any domain components that are used to segregate authentication.
- To use Kerberos in an SASL Bind, ensure that the Kerberos realm for LDAP user authentication from Macintosh computers is the default Kerberos realm.
Procedure
1. In Avamar Administrator, click the Administration launcher button.
   The Administration window appears.
2. Click the LDAP Management tab.
3. Click Edit LDAP file.
4. In the text area, edit or create the user-login-module key:
   - To specify Kerberos in an SASL Bind, set user-login-module=kerberos.
   - To specify plaintext in a Simple Bind, set user-login-module=ldap.

   Kerberos is the default value. Avamar Desktop/Laptop assumes this value when the key is missing.
5. Click Save.
6. Click Close.

Changing the Kerberos encryption type
If you use LDAP authentication with Kerberos, you may need to change the Kerberos encryption type.

Avamar Desktop/Laptop uses the MIT Kerberos encryption type “DES cbc mode with CRC-32” to communicate with LDAP servers by default. This encryption type may conflict with a key distribution center (KDC) in the Active Directory environment. If that occurs, the message KDC has no support for encryption type appears. To resolve this issue, remove the specified encryption type from the krb5.conf configuration file, which enables the KDC to select the encryption type.

Procedure
1. In Avamar Administrator, click the Administration launcher button.
   The Administration window appears.
2. Click the LDAP Management tab.
3. Click Edit KRBS5 file.
4. In the text area, find the following entries:

   [libdefaults]
default_tgs_enctypes = des3-cbc-shal-kd des-cbc-crc des-cbc-md5
default_tkt_enctypes = des3-cbc-shal-kd des-cbc-crc des-cbc-md5

5. Comment out the entries:

   [libdefaults]
   #default_tgs_enctypes = des3-cbc-shal-kd des-cbc-crc des-cbc-md5
   #default_tkt_enctypes = des3-cbc-shal-kd des-cbc-crc des-cbc-md5

6. Click Save.
7. Click Close.
NIS authentication

You can configure Avamar Desktop/Laptop to authenticate Linux users through the enterprise NIS.

When you use NIS authentication, client computers must all use the same static, resolvable, fully qualified NIS domain name. Also, users must have correctly configured user accounts in the NIS domain.

Adding information for a supported LDAP directory service on page 66 provides instructions on configuring NIS authentication.

Avamar authentication

You can configure Avamar Desktop/Laptop to authenticate users by using Avamar authentication, which uses internal Avamar domain information.

Avamar authentication works with users who authenticate at the Avamar root level, Avamar domain levels, or Avamar subdomain levels. The mechanism first checks at the subdomain level. If the username is found at that level, then authentication proceeds. If the username is not found, then the next level is checked. This continues until the username is found, or the Avamar root is reached without finding the username.

For example, if the login computer 123abc.example.com is activated with the /clients/mountain Avamar subdomain, then the mechanism checks the Avamar system in the following order until the username is found:

1. /clients/mountain (activation subdomain)
2. /clients (next level up)
3. / (root)

With Avamar authentication, client computers must have a static, resolvable, fully qualified domain name. In addition, users must have a local or domain login account for the client computer and an account on the Avamar domain associated with the client computer.

Avamar Desktop/Laptop applies the role assigned to the Avamar user account when it grants access to the account through Avamar authentication. Users can perform only those operations that are allowed by their role. The one exception is that users with the Restore only operator role can launch a backup from Avamar Desktop/Laptop.

Configuring Avamar authentication

Configure an Avamar system to use Avamar authentication through the LDAP Management tab of Avamar Administrator.

Before you begin

Add Avamar user records to domain-level lists. Adding a user to a client or domain on page 83 provides instructions.

Procedure

1. In Avamar Administrator, click the Administration launcher button.
   
   The Administration window appears.
2. Click the LDAP Management tab.
3. Click Edit LDAP file.
4. Edit or create the user-login-module key:
- To use Avamar authentication and all other configured and enabled authentication methods, set `user-login-module=mix`.
- To use Avamar authentication and all other configured and enabled authentication methods except LDAP, set `user-login-module=avamar`.

5. In the text area, type the following key/value pair:

   \[
   \text{avamar-authentication-domains}=/\text{domain1},/\text{domain2},/\text{domain3},/\ldots
   \]

   where `domain1`, `domain2`, and `domain3` are Avamar domain names that are combined in a comma-separated list. Each domain name must begin with the root path designator: `/`

   For example, to use Avamar authentication for the following domains:

   /  
   /clients/accounting  
   /clients/shipping

   Type the following key/value pair:

   \[
   \text{avamar-authentication-domains}=/\text{clients/accounting},/\text{clients/shipping}
   \]

6. Click **Save**.
7. Click **Close**.

### Mixed authentication

You can use multiple authentication methods in the same environment.

The authentication process occurs in the following order when you enable multiple authentication methods:

1. Users on a client in an Avamar domain are authenticated by using Avamar authentication.
2. Users who are not logged in to a client in an Avamar domain are authenticated by using pass-through authentication.
3. Linux users who are not logged in to a client in an Avamar domain are authenticated through NIS.
4. When mixed authentication is enabled and LDAP is configured, authenticates users, who are not logged in to a client assigned to a specified Avamar domain, through LDAP.

### Avamar Desktop/Laptop user interfaces

Avamar Desktop/Laptop functionality is available through the client UI and the web UI.

#### Client UI

The client local user interface (client UI) is installed on the client computer when you install either the Avamar Client for Windows or the Avamar Client for Mac OS X. With the client UI, an Avamar icon appears in the notification area ("system tray") on Windows computers or on the menu bar on Mac computers. Right-click the icon on Windows or click the icon on Mac to open the client menu, which provides access to backup, restore, program settings, and logs.

The following table lists the functionality that is available in the client UI.
<table>
<thead>
<tr>
<th>Client menu item</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Back Up Now</td>
<td>Launches a single-click on-demand backup.</td>
</tr>
<tr>
<td>Back Up...</td>
<td>Launches an interactive on-demand backup.</td>
</tr>
<tr>
<td>Restore...</td>
<td>Launches an interactive restore.</td>
</tr>
<tr>
<td>Settings &gt; Show Backup Reminder (days)</td>
<td>Controls when a backup reminder appears to remind you that the computer has not been backed up for a period of time between one and seven days. You can also disable the reminder by selecting Never.</td>
</tr>
<tr>
<td>Settings &gt; Show Progress Bar</td>
<td>Controls whether the Progress window appears during a backup. You can cancel, pause, or view logs for a backup from the Progress window.</td>
</tr>
<tr>
<td>Settings &gt; Show Balloon Messages</td>
<td>Controls whether system status balloon messages appear near the Avamar icon on supported Windows computers.</td>
</tr>
<tr>
<td>Settings &gt; Back Up On Battery Power</td>
<td>Controls whether scheduled or on-demand backups can occur for the computer when the computer is running on battery power.</td>
</tr>
<tr>
<td>Settings &gt; Back Up On Wireless</td>
<td>Controls whether scheduled or on-demand backups can occur for the computer when the computer is joined to the network solely by a wireless connection.</td>
</tr>
<tr>
<td>Languages</td>
<td>Enables you to select the language for the client UI.</td>
</tr>
<tr>
<td>Manage &gt; Activate Client</td>
<td>Activates the client, which provides a unique ID for the client and links the client to a specific Avamar server.</td>
</tr>
<tr>
<td>Manage &gt; View Console</td>
<td>Opens the client console, which provides access to local status records for tasks, the Agent Log, the Console Log, and the Work Order Log.</td>
</tr>
<tr>
<td>Manage &gt; Create ZIP File of Logs</td>
<td>Creates a ZIP file of logs required by administrators to diagnose backup and restore problems.</td>
</tr>
<tr>
<td>(Mac only) Client Agent Tasks</td>
<td>Stops or restarts the backup agent process.</td>
</tr>
<tr>
<td>(Mac only) Logs</td>
<td>Provides access to the Agent Log, Console Log, and functionality for creating a ZIP file of logs required by administrators to diagnose backup and restore problems.</td>
</tr>
<tr>
<td>About</td>
<td>Provides version, server, and copyright information for Avamar Desktop/Laptop.</td>
</tr>
<tr>
<td>Help</td>
<td>Launches online help for Avamar Desktop/Laptop when the client is activated to an Avamar server.</td>
</tr>
<tr>
<td>Exit</td>
<td>Shuts down the Avamar client.</td>
</tr>
</tbody>
</table>
### Web UI

Use the web browser user interface (web UI) to start an on-demand backup or restore, view backup and restore activity for a client computer, or configure other backup settings for a client computer.

The following table describes the main elements of the web UI.

<table>
<thead>
<tr>
<th>Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EMC Avamar Desktop/Laptop logo</td>
<td>You can replace the EMC Avamar logo and the Desktop/Laptop logo in the upper left corner of the web UI to rebrand the web UI.</td>
</tr>
<tr>
<td>Settings menu</td>
<td>The settings menu in the upper right corner of the web UI enables you control web UI configuration settings, including:</td>
</tr>
<tr>
<td></td>
<td>- Whether to show tooltips</td>
</tr>
<tr>
<td></td>
<td>- The language for the web UI</td>
</tr>
<tr>
<td></td>
<td>- How many entries to show on the Search, Browse, or History pages</td>
</tr>
<tr>
<td></td>
<td>- The default page that appears when you perform a restore</td>
</tr>
<tr>
<td></td>
<td>- Whether the full web UI or the browse-only mode, which displays only the Search and History pages, is used</td>
</tr>
<tr>
<td>Refresh icon</td>
<td>Refreshes the web UI page.</td>
</tr>
<tr>
<td>Help menu</td>
<td>Provides access to the Avamar Desktop/Laptop online help and to software version information.</td>
</tr>
<tr>
<td>Search page</td>
<td>Enables you to search for files and folders on the client computer to restore.</td>
</tr>
<tr>
<td>Browse page</td>
<td>Enables you to browse to files and folders on the client computer to restore.</td>
</tr>
<tr>
<td>Backup page</td>
<td>Provides information about the backup groups to which the client is assigned, as well as the next scheduled backup. Also enables you to perform an on-demand backup of the client by using the group policies for the groups to which the client is assigned. When the Add Data button is enabled on the Backup page, users can add folders to the group datasets for scheduled and on-demand backups.</td>
</tr>
<tr>
<td>History page</td>
<td>Provides a 14-day record of backup and restore activity on the computer, including:</td>
</tr>
<tr>
<td></td>
<td>- Status of backup activity, and for each backup, a listing of the file data that was transferred</td>
</tr>
<tr>
<td></td>
<td>- Status of restore activity</td>
</tr>
<tr>
<td>Status bar</td>
<td>Displays the date and time of the last and next scheduled backup, as well as the outcome of the last backup. The status bar displays information for the most recent 14 days. When the last backup was more than 14 days in the past, the status bar displays the message No backups found. However, if the retention policy assigned to the group for the client is more than 14 days, you may still see files on the Browse and Search pages.</td>
</tr>
</tbody>
</table>
Limited user interface

The Avamar server presents a limited version of the web UI to a client when the number of files and directories in a client backup exceeds about 4 million or when there is insufficient allocated memory for Avamar Desktop/Laptop.

**Large number of files and directories in a client backup**
The exact number of files and directories that causes these changes is based on the available memory on the Avamar server.

There is no upper limit to the number of files and directories that can be in a backup.

**Insufficient allocated memory**
The limited version of the web UI also appears for all clients accessing the Avamar server when the memory it requires to satisfy its current Avamar Desktop/Laptop requests exceeds the memory that it has allocated for Avamar Desktop/Laptop.

Encouraging users to log out of the web UI at the end of their session helps prevent this issue.

**Description of the limited web UI**
The limited version of the web UI has the following changes:

- The Search and History pages do not appear the web UI.
- File versions are not available on the Browse page.
- Restore is only allowed for users with local administrator rights on the computer. Non-administrator users cannot restore any files, including those that they own locally on a server-class computer.
- Restore data size limits are not enforced.

Apache web server authentication

To protect user security, web browsers display an authentication warning when accessing a secure web page unless the web server provides a trusted public key certificate with the page. The Avamar Desktop/Laptop web UI uses only secure web pages, and this warning is seen in browsers that access those pages. To avoid the warning, install a trusted public key certificate on the Apache web server provided with Avamar.

The *EMC Avamar Product Security Guide* describes how to obtain and install a trusted public key certificate for the Apache web server.

Rebranding the web UI

You can rebrand the Avamar client web UI by replacing the two logo graphics in the upper left corner of the UI.

**Figure 15** Replaceable graphics on the Avamar client web UI
Procedure

1. Create two replacement graphics that are named `ProductNameAvamar.png` and `ProductNameDTLT.png`.
   
   The replacement graphics must meet the following requirements:
   
   - The file format must be Portable Network Graphic (.png).
   - The background must be transparent so that the background gradient is visible behind the graphic text and images.
   - `ProductNameAvamar.png` must be 97 pixels wide and 18 pixels tall.
   - `ProductNameDTLT.png` must be 128 pixels wide and 18 pixels tall.

2. Open a command shell and log in by using one of the following methods:
   
   - For a single-node server:
     a. Log in to the server as admin.
     b. Switch user to root by typing `su -`.
   - For a multi-node server:
     a. Log in to the utility node as admin.
     b. Load the dpnid OpenSSH key by typing:
        
        ```
        ssh-agent bash
        ssh-add ~admin/.ssh/dpnid
        ```
     c. When prompted, type the `dpnid` passphrase and press Enter.

3. Change the working directory by typing the following command:
   
   ```
   cd /usr/local/avamar-dtlt-tomcat/webapps/dtlt/images/banner
   ```

4. Make backup copies of the original graphics by typing the following commands:
   
   ```
   cp ProductNameAvamar.png ProductNameAvamar.png_orig
   cp ProductNameDTLT.png ProductNameDTLT.png_orig
   ```

5. Move the new logos to the current working directory as `ProductNameAvamar.png` and `ProductNameDTLT.png`.

6. If the new graphics do not appear, delete the cached copies of previously viewed files in the web browser, and then refresh the page.

Changing the web UI port

Access to the web UI requires HTTPS communication between the Avamar server and the client web browser. When a user requests a backup or restore by using the Avamar client menu, the default web browser on the client is instructed to contact the Avamar server on port 443, the standard HTTPS port. On the Avamar server, this initial request to port 443 is redirected to port 8443, the HTTPS port for the web UI. You can change the initial contact port by editing the `avscc.cfg` configuration file on the client and the Apache SSL configuration file on the server.

Procedure

1. Edit the `avscc.cfg` file on the client computer to use the new port number:
   
   a. Open `avscc.cfg` in a text editor.
On Windows clients, the file is in the `%SystemDrive%\Program Files\avs\var` directory. On all other clients, the file is in the `/usr/local/avamar/var` directory.

If `avscc.cfg` does not exist at this location, then create the file.

b. Add the following line to the file:

```
--dtlt-port=n
```

where `n` is the initial contact port number.

c. Save and close `avscc.cfg`.

d. Restart the client.

2. Edit the Apache SSL configuration file on the Avamar server:

   a. Open a command shell and log in as admin on a single-node server or on the utility node of a multi-node server.

   b. Open the Apache SSL configuration file in a text editor.

      On Red Hat Enterprise Linux, the file is `/etc/httpd/conf.d/ssl.conf`. On SuSE Linux Enterprise Server, the file is `/etc/apache2/vhosts.d/vhost-ssl.conf`.

   c. Find the HTTPS port listening directive and change `Listen 443` to `Listen n`, where `n` is the initial contact port number.

   d. Save and close the file.

   e. Restart the Apache server process by typing `apachectl restart`.

Changing the secure token time-out value

Avamar Desktop/Laptop includes a temporary secure token as part of the URL it uses to begin a backup or restore session in a client web browser. The client web browser must establish an HTTPS connection with the Avamar server before the token expires or the session is rejected and the backup or restore cannot proceed. You can edit the default time-out value of 20 seconds.

**Procedure**

1. Open a command shell and log in by using one of the following methods:

   - For a single-node server, log in to the server as admin.
   - For a multi-node server:
     a. Log in to the utility node as admin.
     b. Load the admin OpenSSH key by typing:

       ```
       ssh-agent bash
       ssh-add ~admin/.ssh/admin_key
       ```

     c. When prompted, type the `admin_key` passphrase and press Enter.

2. Stop the MCS by typing the following command:

   `dpnctl stop mcs`

3. Change the working directory by typing the following command:

   `cd /usr/local/avamar/var/mc/server_data/prefs`
4. Open mcserver.xml in a text editor.
5. In the <node name="dtlt"> section, edit the value of <entry key="expire_data_after_secs" value="20" /> from 20 to the new time-out value in seconds.
6. Save the change and close the file.
7. Start the MCS and the scheduler by typing:
   
   ```
   dpntctl start mcs
   dpntctl start sched
   ```

Forcing clients to use the alternate file browsing method

The Avamar client web UI uses the OS-specific file browsing services on the client computer to provide a file manager interface for users to select local files and folders to back up or restore. However, if these services are not available because the client uses NAT or because port 28002 on the client is blocked by a firewall rule, then an alternate file browsing method is offered. You can require clients to use the alternate file browsing method.

One reason to make this change is to provide support for removable media. The default file browsing method does not support removable media, but the alternate method does. The alternate method uses a Java applet to provide file browsing services. When the default services are unavailable, and the user elects to permit the alternate method, the Java applet is loaded. During loading of the applet, the user may see authentication warnings about the website certificate of the Avamar server and the digital signature of the Java applet. You must acknowledge these warnings or the applet does not load.

After the applet loads, the web page is automatically refreshed to allow the Avamar client web UI to use the applet. The user must restart the task after the page is refreshed.

To force clients to use the alternate file browsing method, add the `useAppletToBrowseLocalFile` property to the `dtlt.properties` file on the Avamar server, and set the value to `true`.

Backup with Avamar Desktop/Laptop

Avamar Desktop/Laptop provides several methods for starting a client backup.

The following table describes the methods for starting a client backup, and the options that are available for the method.

<table>
<thead>
<tr>
<th>Method</th>

</tr>
</tbody>
</table>

Scheduled backups

Perform scheduled backups of Avamar Desktop/Laptop client computers the same way that you back up other Avamar client computers in the environment. Create datasets, schedules, retention policies, and groups for the backups by using Avamar Administrator.

Users see the groups that are associated with an Avamar Desktop/Laptop client on the **Backup** page in the web UI.

The next scheduled backup time for each group associated with an Avamar Desktop/Laptop client also appears on the **Backup** page. The group's policy normally determines the schedule start time for that group's backups. For individual Avamar Desktop/Laptop clients, you can permit users to select a different start time for their client's scheduled backups.

Allowing users to select the start time for scheduled backups

Permit users of an Avamar Desktop/Laptop client to select a start time for the client's scheduled backups that is different from the start time that is assigned through group policy.

When you enable this feature for an Avamar Desktop/Laptop client, users can select from a list of administrator-defined times that appear on the **Backup** page in the web UI. The selected start time applies to all subsequent scheduled backups for the client.

To prevent gaps in protection, Avamar Desktop/Laptop clients continue to use the user-selected backup start time even when you remove that time from the **Override Daily Schedule**. When the user next logs in to the web UI Avamar Desktop/Laptop prompts the user to select a new start time from the **Backup** page.

The Avamar server associates a user-selected start time with the client's group. Removing the client from a group also removes the user-selected start time for that client.

Procedure

1. Ensure that the client belongs to a group that uses a daily schedule.
2. Using Avamar Administrator, add time entries to the **Override Daily Schedule**.

To add time entries to the **Override Daily Schedule**, complete the task that is described in Editing the start times for client overrides of group schedules on page 99.
Note

The **Override Daily Schedule** displays time values using the time zone of the Avamar server. Avamar Desktop/Laptop uses the time zone of the client when displaying the times that appear on the **Backup** page.

3. Using Avamar Administrator, enable **Allow override of group's daily schedule** for the client.

**Overriding group policy settings for a client on page 111** provides instructions for setting **Allow override of group's daily schedule**.

**Add data option**

For scheduled backups and for on-demand backups, allow users to specify folders to include in the group policy-based backups of an Avamar Desktop/Laptop client computer.

When the Add data option is enabled, Avamar Desktop/Laptop creates backup datasets for the client computer by adding the folders that the user selects to the dataset of each group that the Avamar Desktop/Laptop client computer belongs to. Avamar Desktop/Laptop applies the exclusions and inclusions in the dataset policy of each group to the folders that the user specifies.

Use Avamar Administrator to enable this option. **Overriding group policy settings for a client on page 111** provides instructions for using Avamar Administrator to enable **Allow additions to source data**.

After you enable the Add data option, users add folders by clicking **Add Data** on the **Backup** page of the web UI, and selecting the folders.

**Single-click backups**

Users can start an on-demand backup on an Avamar Desktop/Laptop client computer by a single click on the **Back Up Now** button on the client menu or on the backup reminder dialog box.

The data that is included in a single-click backup depends on the operating system of the client computer. The following table describes the data that is included for specific operating systems. When the Add data option is enabled, Avamar Desktop/Laptop also adds user selected folders to the data included in the backup.

**Table 110** Datasets for single-click on-demand backups

Interactive backups

Interactive backups allow users to select a backup group that is associated with the client and back up the client by using the group's settings. When on-demand backup sets are enabled, interactive backups also allow users to choose instead to back up only selected files and folders.

Group selection

Users perform an interactive backup of a single group by selecting Back Up... on the client menu, selecting the backup group on the Backup page in the web UI, and then clicking Back Up Now.

When a user runs an interactive backup of a group, all policies that are associated with the selected group apply to the backup.

An interactive backup of a group differs from a single-click backup because in an interactive backup of a group only the selected group is backed up.

File and folder selection

To allow users to back up selected files on an Avamar Desktop/Laptop client without regard for the group policies that are assigned to the client, enable on-demand backup sets. After enabling on-demand backup sets, users on Windows, Mac, and Linux computers that are Avamar Desktop/Laptop clients can create sets of folders and files to back up through on-demand backups. Users can create multiple sets, save the sets for reuse, and send a backup that is based on a set to the backup queue of the Avamar server.

On-demand backup sets do not change the data that is backed up according to the group policies that are assigned to the Avamar Desktop/Laptop client.

The Avamar server can be configured to limit the number of on-demand backup set backups that can be started from an Avamar Desktop/Laptop client.

Allowing users to create on-demand backup sets

Enable users on Windows, Mac, and Linux clients that use Avamar Desktop/Laptop to create on-demand backup sets.

Procedure

1. Enable the Allow file selection on client initiated backups setting in Avamar Administrator. Overriding group policy settings for a client on page 111 provides instructions.

2. Change the value of the allowUserInititedBackupsFileSelection key in the dtlt.properties file on the Avamar server to true.

3. Users create the on-demand backup sets:

   a. On the Avamar Desktop/Laptop client computer, right-click the Avamar icon and select Back Up....
      The web UI opens to the Backup page.
   
   b. In Select folders and files to backup, click Select Now.
      The On-Demand Backup Sets dialog box appears.
   
   c. Select the folders and files to back up, and click OK.
   
   d. To save the backup set for reuse, type a name for the backup set in Save backup set as, and click Save.
e. (Optional) To instruct the Avamar server to add a backup of the on-demand backup set to the backup queue, click Start Backup, and click OK.

4. Users instruct the Avamar server to add a backup of a saved on-demand backup set to the backup queue:
   a. On the Avamar Desktop/Laptop client computer, right-click the Avamar icon and select Back Up....
      The web UI opens to the Backup page.
   b. In Select folders and files to backup, click Select Now.
      The On-Demand Backup Sets dialog box appears.
   c. In Load Backup Set, select the backup set.
   d. Click Start Backup, and click OK.

Setting an on-demand backup limit

Set a limit on the number of on-demand backup set backups that a user can add to the Avamar server’s task queue.

By default, Avamar server uses the following rules for on-demand backup set backups:

- Only one on-demand backup set backup from a client is allowed in the task queue at a time.
- An on-demand backup set backup cannot start while a backup for the client is running.
- No limit on the number of on-demand backup set backups of a client that a user can add to the task queue.

To set a limit on the number of on-demand backup set backups that can occur each day for Avamar Desktop/Laptop client computers, set the restrictBackupsPerDay property in the dtlt.properties file on the Avamar server.

The following table describes the available values.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td>There is no limit on the number of on-demand backup set backups that can successfully run in a day. No limit is the default setting.</td>
</tr>
<tr>
<td>0</td>
<td>Users cannot run on-demand backup set backups.</td>
</tr>
<tr>
<td>n</td>
<td>No more than $n$ on-demand backup set backups can occur for each client in a day. As used here, $n$ is any positive integer less than or equal to 100, and a day is defined as midnight to midnight in the time zone for the Avamar server.</td>
</tr>
</tbody>
</table>

The specified value applies to all clients activated on the Avamar server. All successfully completed backups for all users on an Avamar Desktop/Laptop client computer count toward the total number of backups allowed each day.

Note
This limit applies only to backups that are based on a user-created on-demand backup set.
Disabling on-demand backups

Prevent users from performing on-demand backups from Avamar Desktop/Laptop client computers. This setting applies to both single-click on-demand backups and interactive on-demand backups.

Procedure

1. In Avamar Administrator, click the Policy launcher button.
   The Policy window appears.
2. Click the Clients tab.
3. Disable on-demand backups for either a single client or multiple clients.

<table>
<thead>
<tr>
<th>Number of clients</th>
<th>Steps to disable on-demand backups</th>
</tr>
</thead>
</table>
| One               | a. Select the client and click Edit.  
                     b. In the Edit Client dialog box, clear Allow client initiated backups.  
                     c. Click OK. |
| Two or more       | a. Select the clients and click Edit.  
                     b. In the Edit Multiple Clients dialog box, change Allow client initiated backups to No.  
                     c. Click Apply Change.  
                     d. Click OK. |

Changing the retention policy for on-demand backups

The End User On Demand Retention policy controls the retention of data for on-demand backups. You can change the End User On Demand Retention policy on an Avamar server by using Avamar Administrator. The change applies to all on-demand backups initiated by a client activated with that server. However, the change only applies to on-demand backups that occur after the change.

Procedure

1. In Avamar Administrator, select Tools > Manage Retention Policies.
   The Manage All Retention Policies window appears.
2. Select End User On Demand Retention from the list and click Edit.
   The Edit Retention dialog box appears.
3. In Retention period, type a number and select a unit of time (days, weeks, months, or years).
4. Click OK.
Restore with Avamar Desktop/Laptop

The following topics provide information on performing a restore and controlling restore-related settings in Avamar Desktop/Laptop.

Finding data to restore

Avamar Desktop/Laptop users can use the web UI to either browse to or search for folders, files, and file versions to restore.

Browsing for data to restore
From the left-side menu, select Browse to view the backups for a client computer in a tree view that you can browse to find folders and files to restore.

To browse a specific backup instead of all backups for the client, use Backup Date and Time to select the date and time of the backup.

Searching for data to restore
From the left-side menu in the web UI, select Search to search for specific folders and files to restore. To start a search, type a search string in the search field, and click Search. Results appear as they are gathered, and a progress indicator provides information about the length of the search.

The search string that you specify in the search field must be 255 characters or fewer and is not case sensitive. Supported wildcards in the search string include an asterisk (*) to represent zero or more characters and a question mark (?) to represent one character.

The string is compared to the names of all folders and files in the backups for the client computer. If all or part of a folder or file name matches the string, then the folder or file name appears in the search results.

Selecting a file version
The backups for a client computer contain more than one version of many of the files that are backed up. When a file is backed up and then subsequently edited, the next backup contains a new version of the file. Each version is kept for the retention period set by the Avamar administrator.

The number of versions of a file in the client backups depends on many factors, including:

- The length of time that backed up data is retained
- The frequency of backups
- How often the file is edited

When there are multiple versions of a file in the backups for a client, a version icon appears next to the file name when you browse or search for data to restore. To select a version of the file other than the most recent version, click the version icon and then select the version. Then choose whether to overwrite the existing file on the client computer or to restore the file version with a new name.

Restore types

Avamar Desktop/Laptop users can restore data to the original location or to a new location on the same computer. Users can restore data with the same name or a new name.

When users restore data to the original location with the same name, the restore process overwrites any current local file versions with the restored files. This type of restore is
useful in situations where the current local versions contain errors or have data corruption issues.

To avoid overwriting the current local file versions, users can restore to a new location, restore with a new name, or both.

Domain users can restore files from any Windows or Mac computer on which they have a user profile to the Windows or Mac computer to which they are logged in. You can disable restore from a different computer by setting the value of the `disableRestoreFromAlternateComputer` property in the `dtlt.properties` file on the Avamar server to `true`. This is a global property that affects all clients.

**Restore requirements**

Review the permissions requirements and the requirements to restore from a different computer before you perform a restore.

**Restore permissions**

The data that users can browse to, search for, and restore depends on user login account permissions.

When users search or browse for data to restore, the results that appear are filtered based on the current login credentials and the data that has been backed up from the client computer. The following table provides details on the filtering.

<table>
<thead>
<tr>
<th>Data type</th>
<th>Filtering on Windows</th>
<th>Filtering on Mac</th>
</tr>
</thead>
<tbody>
<tr>
<td>Folders</td>
<td>Displays all folders for which the logged in user is owner or is a member of a group with ownership rights, and any folder that contains folders or files for which the user has rights.</td>
<td>Displays all folders for which the logged in user has Read permission either as owner or based on the folder’s group or other permissions.</td>
</tr>
<tr>
<td>Files</td>
<td>Displays all files that the logged in user owns.</td>
<td>Displays all files that the logged in user owns.</td>
</tr>
</tbody>
</table>

When users browse for data to restore, a folder that a user does not have ownership rights for appears when it is on the file system path for a folder or file for which the user does have ownership rights. This helps to provide a more accurate representation of the file system on the computer. A dimmed checkbox appears next to the folders, and the folders are not restored when you restore a folder or file that includes them in its path.

Users can restore data only if their login credentials grant operating system Write permission for the restore location. Also, to restore data that has the same path and name as data on the client computer, the login credentials must authenticate the user as the owner of the existing data before the restore proceeds.

To restore files on Windows, the login account must have the `Restore files and directories` user right in Local Security. This user right is assigned by default to accounts that are members of either the Administrators or Backup Operators groups. You must assign this right to an account that is not a member of either of these groups, or of another group that includes this user right, before a user can use the account to restore data.
Requirements to restore from a different computer

To restore from a different computer, the requirements in the following table must be met.

Table 113 Requirements to restore from a different computer with Avamar Desktop/Laptop

<table>
<thead>
<tr>
<th>Category</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>Operating system</td>
<td>• Windows operating system&lt;br&gt;• Mac operating system&lt;br&gt;Note:&lt;br&gt;Restores between Windows and Mac computers are supported.</td>
</tr>
<tr>
<td>Account type</td>
<td>Domain</td>
</tr>
<tr>
<td>Profile</td>
<td>Both source and target computers have a local profile for the user's domain account.&lt;br&gt;Note:&lt;br&gt;A local profile for a domain account is created automatically at a user's first login on the computer.</td>
</tr>
<tr>
<td>Avamar client</td>
<td>Version 7.0 or later is installed on both source and target.</td>
</tr>
<tr>
<td>Avamar server</td>
<td>Both source and target are activated with the same Avamar server and the server is running Avamar 7.0 or later.</td>
</tr>
<tr>
<td>Backup</td>
<td>There is at least one qualifying backup. A qualifying backup is one completed successfully after both:&lt;br&gt;• Avamar Desktop/Laptop 7.0 or later is installed on the source computer.&lt;br&gt;• A local profile for the user’s domain account is created on the source computer.</td>
</tr>
</tbody>
</table>

By default, users with local administrator rights on a Windows source computer at the time of a backup can restore any file from that source computer to a target computer, regardless of file ownership. You can change this behavior to restrict their access to only files that they own. To restrict file access for Windows administrators, change the value of the checkAlternateComputerOwnership property in the dtlt.properties file on the Avamar server to true.

Restore limits

You can limit the amount of data in a single restore task and the number of concurrent restore tasks for a client computer.

Restore data size limit
Avamar client users do not normally have a limit on the amount of data that is restored in a single task. This default setting enables a user to restore an entire backup in a single task. Very large restore tasks can sometimes cause undesirable load on the network. Set a restore data size limit to control the network load caused by these large restore tasks.
When you set a limit, individual users cannot restore more than the limit in any one restore task. Users must restore files that exceed the limit in multiple tasks that do not exceed the limit, or an administrator must perform the restore.

**NOTICE**

By design, the restore data size limit does not apply to server-class clients (those clients with a very large backup data set).

To specify a restore data size limit, uncomment the `limitRestoreSize` key in the `dtlt.properties` file on the Avamar server, and set the value to the data size limit in MB.

**Restore queue limit**

The Avamar client web UI minimizes network and server load by blocking restore requests for clients that already have a restore task in the queue. Users who attempt to start a new restore while one is pending receive a message, and the request is blocked. After the pending task is complete, users can initiate a new restore task. You can change this behavior to allow users to start multiple restore tasks. The change applies to all clients of the Avamar server.

To remove the restore queue limit, change the value of the `disallowMultipleRestores` property in the `dtlt.properties` file on the Avamar server to `false`.

**Restore of replicated backups**

You can move an Avamar client to a new Avamar server by using Avamar Client Manager replication commands. When you move a client, the backups for the client are replicated on the new server. Avamar Desktop/Laptop must index replicated backups before they are available to browse or search in the web UI.

When a user logs in from the web UI on the client after the client has been moved, the Replicated Backups Available dialog box appears. The user can either start indexing of the replicated backups or close the dialog box without starting indexing. When the user closes the dialog box without indexing, an alert icon appears on the web UI banner bar. The user can also start indexing from the alert icon.

Indexing is a one-time task for a computer that has been moved to a new server. It runs in the same session in which it is started. When it completes, Avamar Desktop/Laptop sends the web browser a refresh command, and the data from the replicated backups appears in the web UI.

**Client backup and restore activity history**

The History page in the Avamar Desktop/Laptop web UI provides a 14-day record of backup and restore activity on the client computer.

The Activity History section of the History page provides information about each backup and restore initiated during the past 14 days. It also provides links to more detailed information about the backups. Information includes the results of the activity, the start date and time, the duration of the activity, the amount of data, and the workorder ID. Click the activity label for a backup to view a list of files in the dataset for the backup.

To view the backup history for a different computer, select the computer from the list. The requirements in Requirements to restore from a different computer on page 339 must be met before you can view the backup history for a different computer.
Editing Avamar Desktop/Laptop parameters

The Avamar Desktop/Laptop properties file, `dtlt.properties`, enables you to change parameters that affect functionality for all Avamar Desktop/Laptop clients that connect to the Avamar server. The file is on the Avamar server at: `/usr/local/avamar/etc/dtlt.properties`.

**Procedure**

1. Open a command shell and log in by using one of the following methods:
   - For a single-node server:
     a. Log in to the server as admin.
     b. Switch user to root by typing `su -`.
   - For a multi-node server:
     a. Log in to the utility node as admin.
     b. Load the dpnid OpenSSH key by typing:
       ```
       ssh-agent bash
       ssh-add ~admin/.ssh/dpnid
       ```
     c. When prompted, type the dpnid passphrase and press Enter.

2. Change directory to `/usr/local/avamar/etc` by typing the following command:
   ```
   cd /usr/local/avamar/etc
   ```

3. Open `dtlt.properties` in a text editor.

4. Create or edit parameters.

5. Save and close the file.

**Avamar Desktop/Laptop parameters**

The following table lists the parameters that are available in the `dtlt.properties` file.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>allowLocalUsers</code></td>
<td>Enables and disables local user access for pass-through authentication. Uncomment the parameter by removing the <code>#</code> in front of the parameter, and then set the value to <code>true</code> to enable local user access for pass-through authentication. Use the default value of <code>false</code> to disable local user access for pass-through authentication.</td>
</tr>
<tr>
<td><code>allowServerRestores</code></td>
<td>Enables or disables locally started restores on server class computers. Use the default value of <code>true</code> to allow restores on server class computers, or <code>false</code> to disable restores on server class computers.</td>
</tr>
<tr>
<td><code>allowUserInitiatedBackupsFileSelection</code></td>

## Avamar Desktop/Laptop parameters (continued)

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>allowUserInitiatedBackupsFileSelection</td>
<td>Use the default value of false to disable selectable backup sets.</td>
</tr>
<tr>
<td>checkAlternateComputerOwnership</td>
<td>Controls whether users with local administrator rights can restore any file from the source computer or only files that they own. Specify true to restrict local administrators to restore only files that they own, or the default value of false to allow local administrators restore any file from the source computer.</td>
</tr>
<tr>
<td>disableRestoreFromAlternateComputer</td>
<td>Enables or disables restore from a different computer. Specify true to disable restore from a different computer, or the default value of false to enable restore from a different computer.</td>
</tr>
<tr>
<td>disallowMultipleRestores</td>
<td>Controls whether users can start multiple restore tasks for a client computer simultaneously. Specify false to allow multiple simultaneous restores, or use the default value of true to prevent multiple simultaneous restores.</td>
</tr>
<tr>
<td>limitRestoreSize</td>
<td>Controls whether to limit the amount of data that is restored in a single task. To specify a limit, uncomment the limitRestoreSize parameter and specify the data size limit in MB. The default limit is 500 MB.</td>
</tr>
<tr>
<td>maxDirectoryDepth</td>
<td>Specifies the number of nested subfolders in each hierarchical branch of a backup that the Avamar Desktop/Laptop server traverses during indexing. The default value is 3000.</td>
</tr>
<tr>
<td>restrictBackupsPerDay</td>
<td>Controls whether there is a limit to the number of on-demand backups that can be performed from the client computer in a single day, and if so, the maximum number. Use the default value of false if you do not want to limit the number of on-demand backups that can successfully run in a day. Specify 0 to disable on-demand backups on the client computer. To limit the number of on-demand backups that can successfully run in a day, specify the limit as a positive integer that is less than or equal to 100.</td>
</tr>
<tr>
<td>useAppletToBrowseLocalFile</td>
<td>Controls whether users use the OS-specific file browsing services on the client computer or the alternate file browsing method. Specify false to allow users to use the OS-specific file browsing services, or true to force users to use the alternate file browsing method. The default value is false.</td>
</tr>
<tr>
<td>userLoginRequired</td>
<td>Enables and disables pass-through authentication. Use the default value of false to enable pass-through authentication, or true to disable pass-through authentication.</td>
</tr>
</tbody>
</table>

## Client log locations

Local logs on client computers provide information about backup and restore operations and UI functionality.

### Available logs

The following table lists the available logs on client computers.
Table 115 Available client logs

<table>
<thead>
<tr>
<th>Log type</th>
<th>Log file name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Workorder</td>
<td>workorder_name.log, where workorder_name is the full name of a task</td>
<td>Provide detailed information about a specific task.</td>
</tr>
<tr>
<td>Agent</td>
<td>avagent.log</td>
<td>Provides information about the status of all backup and restore activity on the computer.</td>
</tr>
<tr>
<td>Console</td>
<td>avscc.log</td>
<td>Provides information about the performance of the UI. A console log is created for each user on a computer.</td>
</tr>
</tbody>
</table>

These logs are accessible through the client UI, and also can be accessed directly.

Log locations on Windows computers
On Windows computers the logs are available through the paths in the following table.

Table 116 Paths to logs on Windows computers

CHAPTER 14

Data Domain System Integration

This chapter includes the following topics:

- Overview of Data Domain system integration ....................................................... 346
- Preparing to add a Data Domain system .............................................................. 350
- Adding a Data Domain system ........................................................................... 353
Overview of Data Domain system integration

You can store Avamar backups on one or more Data Domain systems, and then seamlessly restore data from the backups.

You can back up both file system and application data to a Data Domain system. Storage of Avamar backups on a Data Domain system is recommended in environments with databases that are large and have a high change rate. Store the following types of backups on the Avamar server instead:

- File system backups
- Virtual machine backups
- Remote office backups
- Desktop/laptop backups
- Backups of databases with low change rates

When you store VMware image backups on a Data Domain system, you can boot a lost or corrupted virtual machine almost instantly from the backup by using the instant access feature.

You also can store Avamar checkpoints for a single-node server or Avamar Virtual Edition (AVE) on a Data Domain system.

Integration of Avamar with Data Domain

DD OS software handles the deduplication of data on a Data Domain system. The Data Domain Boost (DD Boost) library provides an interface for an Avamar system to send data that is deduplicated at the source to a Data Domain system.

Avamar uses the DD Boost library through API-based integration to access and work with directories, files, and other items on the Data Domain File System. The DD Boost API gives an Avamar system an interface into some of the properties and capabilities of the Data Domain system. This interface enables an Avamar system to control backup images that are stored on Data Domain systems. It also enables Avamar to manage maintenance activities and to control replication to remote Data Domain systems.

DD Boost is installed on the backup clients and on the Avamar utility node or an Avamar single node system. DD Boost is installed automatically when you install the Avamar client or server software.

You can specify whether specific backup datasets are stored on an Avamar server or a Data Domain system.

When you select an Avamar server as the backup target, the Avamar client on each host performs deduplication segment processing. The Avamar client sends the backup data and the associated metadata to the Avamar server.

When you select a Data Domain system as the backup target, the backup data is transferred to the Data Domain system. Simultaneously, the Avamar client sends the associated metadata to the Avamar server for storage. The metadata enables the Avamar management system to perform restore operations directly from the Data Domain system without first staging the restored data on the Avamar system.

The process of data recovery is transparent to the backup administrator. The backup administrator uses the same Avamar recovery processes that are native to current Avamar implementations.
File system backups on a Data Domain system

Avamar supports Data Domain system storage of file system backups for the following operating systems:

- Windows and Windows Server
- IBM AIX
- HP-UX (IA-64 only, requires ONCPlus Library revision 11.31.06 or later)
- Solaris (for Solaris 10 on SPARC, client side deduplication is disabled and deduplication is performed on the Data Domain system)
- Red Hat Enterprise Linux (RHEL)
- SUSE Linux Enterprise Server (SLES)
- Mac 10.8, 10.9, and 10.10

Only 64-bit operating systems are supported. You cannot store file system backups of desktop/laptop computers on a Data Domain system. The EMC Avamar Compatibility and Interoperability Matrix on EMC Online Support provides updated client compatibility information, including a complete list of supported operating system versions and service packs.

Application backups on a Data Domain system

You can store application data backups from the following Avamar plug-ins on a Data Domain system:

- Avamar Plug-in for DB2
- Avamar Plug-in for Exchange VSS
- Avamar Plug-in for Hyper-V VSS
- Avamar Plug-in for Lotus Domino
- Avamar Plug-in for Oracle
- Avamar Plug-in for SAP with Oracle
- Avamar Plug-in for SharePoint VSS
- Avamar Plug-in for Sybase ASE
- Avamar Plug-in for SQL Server

You can also store VMware image backups and backups with the Avamar NDMP Accelerator on a Data Domain system.

VMware instant access

When you store VMware image backups on a Data Domain system, you can boot a lost or corrupted virtual machine almost instantly from the backup by using the instant access feature.

With instant access, the virtual machine image backup is staged to a temporary NFS share on the Data Domain system. You can then use the vSphere Client to power on the virtual machine and initiate a vMotion of the virtual machine to a datastore within the vCenter. When the vMotion is complete, the restored virtual machine files no longer exist on the Data Domain system. Then you use Avamar Administrator to delete the NFS share on the Data Domain system.
Note
When you use instant access, do not leave the virtual machine running on the Data Domain system for extended periods. When the virtual machine runs on the Data Domain system, performance might degrade because of the workflow.

You can also restore a virtual machine to the production environment instead of using instant access. The Avamar software leverages Changed Block Tracking (CBT) to dramatically speed the recovery process.

The *EMC Avamar for VMware User Guide* provides details on instant access and restore of image backups.

**Checkpoints on a Data Domain system**

You can store Avamar checkpoints for a single-node server or Avamar Virtual Edition (AVE) on a Data Domain system that uses DD OS 5.3 or later. Checkpoints are system-wide backups of the Avamar server for disaster recovery purposes.

Storage of checkpoints on a Data Domain system is recommended in environments that do not include replication to a secondary Avamar server or in environments where most client backups are stored on a Data Domain system.

To configure storage of checkpoints on a Data Domain system, select the **Use as target for Avamar Checkpoint Backups** checkbox when you add or edit the Data Domain system in Avamar Administrator.

Contact EMC Professional Service representatives for assistance with rolling back the Avamar server to a checkpoint on a Data Domain system.

**Data Domain system streams**

Each Data Domain system has a soft limit to the maximum number of connection and data streams that can be sustained simultaneously while maintaining performance. The number of streams varies depending on the Data Domain system model.

You configure the maximum number of streams Avamar can use when you add a Data Domain system to the Avamar server. The Avamar server uses the backup stream value to limit the number of concurrent backup or restore jobs.

If the Data Domain system is fully dedicated to the Avamar server, the stream value entered in Avamar Administrator could potentially be the maximum number of streams supported by the Data Domain system model. In cases where the Data Domain system is shared with other third-party applications or another Avamar server, then a subset of the number of streams should be allocated.

Each Avamar backup client that supports multi-stream backups can be configured to use the appropriate number of streams (typically based on the number of databases) through multi-streaming configuration when the Avamar backup job is configured. The streams are released when the backup or restore operation completes. The number of streams allocated should depend on the number and type of Avamar clients that backs up data at about the same time.
Replication with Data Domain systems

When an Avamar system stores backups on a Data Domain system, Avamar replication uses DD Boost to copy backups from the original Data Domain system and to create replicas on another Data Domain system.

Supported replication configurations
The following table lists the supported replication configurations for Avamar replication using DD Boost.

<table>
<thead>
<tr>
<th>Backup storage</th>
<th>Replication storage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Single Data Domain system</td>
<td>Single Data Domain system</td>
</tr>
<tr>
<td>Single Data Domain system</td>
<td>Multiple Data Domain systems</td>
</tr>
<tr>
<td>Multiple Data Domain systems</td>
<td>Single Data Domain system</td>
</tr>
<tr>
<td>Multiple Data Domain systems</td>
<td>Multiple Data Domain systems</td>
</tr>
</tbody>
</table>

In a configuration where the replication storage consists of multiple Data Domain systems, control which system receives the replicas by mapping a domain on the source Avamar server to a destination Data Domain system. Also specify which Data Domain system is the default destination. Avamar replicates to the default destination when a destination Data Domain system is not identified on the Storage Mapping tab of the Replication window in Avamar Administrator.

The EMC Avamar and EMC Data Domain System Integration Guide provides instructions on storage mapping and specifying the default destination Data Domain system.

Replication details
The following details apply to Avamar replication with Data Domain systems:

- Data transfer during replication is between the Data Domain systems, without intermediate staging
- Replication uses DD Boost to copy backups and to write replicas
- Requires a Data Domain replication license
- Does not use Data Domain replication
- Replication is configured and monitored on the Avamar server
- Replication task scheduling uses Avamar replication schedules only
- Data Domain administration tools are not used

Monitoring and reporting Data Domain system status

Avamar can collect and display data for health monitoring, system alerts, and capacity reporting on a Data Domain system by using Simple Network Management Protocol (SNMP).

SNMP enables you to monitor Data Domain activities, events, capacity, and system status in the same way that you monitor activities, events, capacity, and system status for the Avamar server. You configure SNMP settings when you add a Data Domain system to the Avamar configuration.

You can also run reports to analyze the system. The EMC Avamar Reports Guide provides more information about creating reports.
The *EMC Avamar and EMC Data Domain System Integration Guide* provides more information on monitoring system status for a Data Domain system.

**Security with Data Domain system integration**

The following sections provide details on security in an Avamar environment with Data Domain for encryption and user access.

**Encryption**

The DD Boost library supports data encryption between the Avamar client and the Data Domain system for DDOS 5.5 and DDOS 5.6. The DD Boost library does not support data encryption between the Avamar client and the Data Domain system for DDOS 5.4.

Backups from the Avamar client to the Avamar server are always compressed and encrypted.

**User access**

Use caution when granting users access to the Data Domain system. Never provide authorization for a user to access the Data Domain system and manually delete data.

**Data migration to a Data Domain system**

You cannot migrate backup data directly from the Avamar server to the Data Domain system.

To start using the Data Domain system as the backup target for an Avamar client instead of the Avamar server, edit the dataset to use the Data Domain system, and start performing backups to the Data Domain system. When you change the backup target to the Data Domain system, you must perform a full backup.

After you successfully perform a backup to the Data Domain system, you can delete the earlier backups from the Avamar server.

**Preparing to add a Data Domain system**

Before you add a Data Domain system to the Avamar configuration, install and configure both the Avamar server and the Data Domain system. You must also ensure that the environment meets the system requirements, and create a DD Boost user account on the Data Domain system.

**System requirements for Data Domain system integration**

Ensure that the environment meets the necessary system requirements before you add a Data Domain system to the Avamar configuration.

The following table lists the requirements for the Data Domain system.

<table>
<thead>
<tr>
<th>Feature or specification</th>
<th>Requirement for use with Avamar</th>
</tr>
</thead>
<tbody>
<tr>
<td>Data Domain Operating System</td>
<td>DD OS 5.3 or newer</td>
</tr>
<tr>
<td>(DD OS)</td>
<td></td>
</tr>
<tr>
<td>DD Boost</td>
<td>DD Boost 2.6 or newer</td>
</tr>
</tbody>
</table>
Table 119 Data Domain system requirements (continued)

<table>
<thead>
<tr>
<th>Feature or specification</th>
<th>Requirement for use with Avamar</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Note</strong></td>
<td>DD Boost software enables backup servers to communicate with storage systems without the need for Data Domain systems to emulate tape. There are two components to DD Boost: one component that runs on the backup server and another that runs on the Data Domain system. In the context of Avamar, the component that runs on the backup server (DD Boost libraries) is integrated into the Avamar client. DD Boost software is an optional product that requires a license to operate on the Data Domain system.</td>
</tr>
<tr>
<td>Data Domain device type</td>
<td>Avamar supports any Data Domain system that supports the execution of the required DD OS version.</td>
</tr>
<tr>
<td>Data Domain File System</td>
<td>Enable Data Domain File System by using either the Data Domain System Manager or CLI. After you enable file system operations, it may take up to 10 minutes before Avamar Administrator correctly reflects the status of the Data Domain system. The time delay is increased slightly when the Data Domain system is using the DD Extended Retention option. Do not perform backups, restores, or system maintenance operations until the status appears correctly in Avamar Administrator. Otherwise, backups, restores, or system maintenance operations may fail.</td>
</tr>
<tr>
<td>DD Boost</td>
<td>Enable DD Boost on the Data Domain system. When you enable DD Boost, DD Boost becomes the preferred method of connectivity for any clients that are enabled for DD Boost. While this method is acceptable for clients that can take advantage of DD Boost features, it can result in performance degradation for other clients. Proper due diligence and effective data gathering are keys to avoiding such interactions, especially during upgrades.</td>
</tr>
<tr>
<td>DD Boost user account</td>
<td>The DD Boost library uses a unique login account name that is created on the Data Domain system, this account name is known as the DD Boost account. Only one DD Boost account exists per Data Domain system. If the account is renamed and/or the password is changed, these changes must be immediately updated on the Avamar system by editing the Data Domain configuration options. Failure to update the DD Boost account information could potentially yield integrity check errors or backup and restore problems. The DD Boost account must have administrator privileges.</td>
</tr>
</tbody>
</table>

**Capacity requirements**

Carefully assess backup storage needs when evaluating how much data to store on the Data Domain system and the Avamar server. Include estimates from data that is sent to the Data Domain system from any other servers.

When the Data Domain system reaches its maximum storage capacity, no further backups to the Data Domain system occur until additional capacity is added or old backups are deleted.
Requirements when using other backup products

Data Domain systems can use other third-party backup and archiving software. The Avamar server does not assume it has sole ownership of the Data Domain system. Ensure that proper sizing is evaluated if the system is shared with other software products.

The Avamar server makes no use of the native Data Domain system snapshot and replication features. Replication occurs through the DD Boost SDK library by using copying and cloning. However, other third party products may make use of the native Data Domain system snapshot and replication features. In this case, a snapshot of an entire Data Domain system or a replication of an entire Data Domain system includes the Avamar data.

Network requirements

The Avamar server and all Data Domain systems must be on the same local network. Do not connect the Avamar server and Data Domain systems over a Wide Area Network (WAN). Configurations that use a WAN are not supported.

You can use Avamar replication over a WAN to replicate data from source Avamar servers and Data Domain systems to target Avamar servers and Data Domain systems.

Before integrating a Data Domain system with an Avamar server, ensure that enough network bandwidth is available. To obtain the maximum throughput available on a Data Domain system (for restores, level zero backups, and subsequent incremental backups after a level-zero backup), verify that the network infrastructure provides more bandwidth than the bandwidth required by the maximum throughput of the Data Domain system.

The network configuration must also meet the following requirements:

- Assign a Fully Qualified Domain Name (FQDN) to each Data Domain system.
- Do not use IP addresses in place of hostnames when registering a Data Domain system. This can limit the ability to route optimized duplication traffic exclusively through a registered interface.
- Ensure that DNS on the Data Domain system is properly configured.
- Ensure that forward and reverse DNS lookups work between the Avamar server, the Data Domain system, and all backup and restore clients.
- Use Hosts files to resolve hostnames to non-routable IP addresses.
- Do not create secondary hostnames to associate with alternate or local IP interfaces.

NTP requirements

The Avamar server and the Data Domain system must use the same Network Time Protocol (NTP) server.

Port usage and firewall requirements

To enable communication between Avamar and the Data Domain systems, review and implement the port usage and firewall requirements in the following documents, which are available on EMC Online Support:

- EMC Avamar Product Security Guide
- Port Requirements for Allowing Access to Data Domain System Through a Firewall Technical Note

Creating a DD Boost user account

Before you can add a Data Domain system to the Avamar configuration, prepare the Data Domain system by enabling DD Boost and creating a DD Boost user account for the
Avamar server to use to access the Data Domain system for backups and restores (and replication, if applicable).

If you change the DD Boost account name or password after you create the account, remember to edit the Data Domain system configuration in Avamar Administrator. Otherwise all backups, restores and maintenance activities fail.

Procedure
1. Disable DD Boost on the Data Domain system by logging into the Data Domain CLI as an administrative user and typing the following command:
   
   `ddboost disable`

2. Create the DD Boost user account with administrator privileges by typing the following command:

   `user add username role admin`

   where `username` is the username for the new account.

3. Set the new account as the DD Boost user by typing the following command:

   `ddboost set user-name username`

   where `username` is the username for the account.

4. Enable DD Boost to allow the changes to take effect by typing the following command:

   `ddboost enable`

Adding a Data Domain system

Procedure
1. In Avamar Administrator, click the Server launcher button.
   
   The Server window appears.

2. Click the Server Management tab.

3. Select Actions > Add Data Domain System.

   The Add Data Domain System dialog box appears.

4. On the System tab, specify Data Domain system information:
   
   a. In the Data Domain System Name box, type the fully qualified domain name of the Data Domain system to add.

   Note

   Do not use an IP address or a secondary hostname that associates with alternative or local IP interfaces. It may limit the ability of Avamar to route optimized deduplication traffic.

   b. In the DDBoost User Name box, type the username of the DD Boost account for Avamar to use to access the Data Domain system for backups, restores, and replication.

   c. In the Password box, type the password for the account that Avamar should use to access the Data Domain system for backups, restores, and replication.

   d. In the Verify Password box, type the password again to verify it.
e. If you have more than one Data Domain system associated with Avamar, you can specify one Data Domain system to be the default replication storage. Select **Use system as default replication storage** if this system is the default replication storage.

f. To store checkpoints for a single-node Avamar server or Avamar Virtual Edition (AVE) server on the Data Domain system instead of the Avamar server, select the **Use as target for Avamar Checkpoint Backups** checkbox.

g. Click **Get Stream Info** to view the maximum number of streams that the Data Domain system supports.

h. Specify the maximum number of streams that Avamar can use at any one time to perform backups and restores:
   - To specify a defined number of streams, type the number in the **Max used by Avamar** box.
   - To specify a maximum number of streams based on the percentage of the total number of supported streams, type the percentage in the **Max used by Avamar** box and then select the **As percentage of the max limit** checkbox.

   Consider both the maximum number of streams that the Data Domain system supports, as well as whether other applications are using streams to send data to and receive data from the Data Domain system.

   If the processes writing to and reading from the Data Domain system use all available streams, then Avamar queues backup or restore requests until one or more streams become available.

5. To configure SNMP, click the **SNMP** tab.

   SNMP configuration enables Avamar to collect and display data for system health monitoring, system alerts, and capacity reporting.

6. Verify the SNMP configuration:
   - The **Getter/Setter Port Number** box lists the port on the Data Domain system from which to receive and on which to set SNMP objects. The default value is 161.
   - The **SNMP Community String** box lists the community string Avamar uses for read-only access to the Data Domain system.
   - The **Trap Port Number** box lists the trap port on the Avamar server. The default value is 163.

7. Click **OK**.

   A progress message appears.

8. When the operation completes, click **Close**.

**Results**

When you add a Data Domain system to the Avamar configuration, Avamar creates an MTree on the Data Domain system for the Avamar server. The MTree refers to the directory created within the DD Boost path. Data Domain systems support a maximum of 100 MTrees. If you reach the limit, then you cannot add the Data Domain system to the Avamar configuration.
APPENDIX A

Command Shell Server Logins

- User accounts ................................................................. 356
- Starting command shell sessions .......................................... 356
- Switching user IDs ........................................................... 356
- Using sudo ............................................................................. 357
User accounts

The following user accounts are commonly used for system administration and maintenance tasks:

- root
- admin
- dpn

The admin and dpn user accounts require authentication by way of Secure Shell (SSH).

Starting command shell sessions

Log in to an Avamar server or utility node through SSH as the admin user to perform configuration and maintenance tasks for the Avamar system.

Procedure

- To start a command shell session on a single-node server, open a command shell and log in to the server as admin.
- To start a command shell session on a multi-node server:
  a. Open a command shell and log in to the utility node as admin.
  b. Load the admin OpenSSH key by typing the following commands:

```bash
ssh-agent
ssh-add ~admin/.ssh/admin_key
```
  c. When prompted, type the `admin_key` passphrase and press Enter.

Switching user IDs

You can switch the user of a command shell session to root by typing `su`, and switch back to the previous login ID by typing `exit`. When you switch the user of a command shell session to dpn, you must also load the dpn OpenSSH key.

Procedure

1. Switch user to the dpn user account and login shell by typing `su - dpn`.
2. When prompted for a password, type the dpn password and press Enter.
3. Load the dpn OpenSSH key by typing:

```bash
ssh-agent
ssh-add ~dpn/.ssh/dpnid
```

Note

To determine the active user account (login ID) of a shell session, type `whoami`.
Using sudo

On Gen4 and later Avamar Data Stores, the admin and dpn user accounts are automatically added to the `sudoers` file. This enables admin and dpn users to execute a limited set of commands that would otherwise require operating system root permission.

Prefixing commands with sudo

Instead of switching user to root with the `su` command, admin and dpn users can directly issue commands normally requiring root permissions by prefixing each command with `sudo`.

For example, the following command installs `MyPackage.rpm`:

```
sudo rpm -ivh MyPackage.rpm
```

If prompted for a password, type the password and press `Enter`.

You might be periodically prompted to retype the admin or dpn password when prefixing other commands with `sudo`. This is normal.

Spawning a sudo Bash subshell

If you need to execute several commands that normally require root permissions, you can spawn a persistent sudo Bash subshell by typing `sudo bash`. Using `sudo bash` enables you to directly type multiple commands with no additional changes to the command line syntax when the commands normally require root permissions.

For example:

```
sudo bash
rpm -ivh MyPackage1.rpm
rpm -ivh MyPackage2.rpm
rpm -ivh MyPackage3.rpm
exit
```
APPENDIX B

Plug-in Options

- How to set plug-in options ................................................................. 360
- Backup options ................................................................................. 360
- Restore options .............................................................................. 363
How to set plug-in options

Plug-in options enable you to control specific actions for on-demand backups, restores, and scheduled backups. The plug-in options that are available depend on the operation type and plug-in type.

You specify plug-in options in Avamar Administrator for on-demand backup or restore operations, or when you create a dataset for a scheduled backup. You set plug-in options with the graphical user interface (GUI) controls (text boxes, checkboxes, radio buttons, and so forth). In addition to using the GUI controls for the options, you can type an option and its value in the Enter Attribute and Enter Attribute Value fields.

**NOTICE**

The Avamar software does not check or validate the information that you type in the Enter Attribute and Enter Attribute Value fields. In addition, the values in the Enter Attribute and Enter Attribute Value fields override settings that you specify with the GUI controls for the options.

Backup options

The backup options that appear depend on the type of plug-in.

This section describes the backup options for the following plug-ins:

- AIX file system
- FreeBSD file system
- HP-UX file system
- Linux file system
- Macintosh file system
- NetWare file system
- SCO OpenServer file system

Backup options for the Avamar Plug-in for Microsoft Windows are available in the *EMC Avamar for Windows Server User Guide*. Backup options for application plug-ins, such as SQL Server and SharePoint VSS, are available in the user guide for the plug-in.

The following tables describe the options that are available when you perform an on-demand backup or when you configure a dataset for scheduled backups for the listed file system plug-ins.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Store backup on Data Domain system</td>
<td>(AIX, HP-UX, Linux, and Macintosh only) Stores the backup on a configured Data Domain system instead of on the Avamar server. To store the backup on a Data Domain system, select the checkbox and then select the Data Domain system from the list.</td>
</tr>
<tr>
<td>Encryption method to Data Domain system</td>
<td>(AIX, HP-UX, Linux, and Macintosh only) Specifies the encryption method for data transfer between the client and the Data Domain system.</td>

<tr>
<td>Informational message level</td>
<td>Specifies how many informational messages to include in the log files. One of the following:</td>
</tr>
<tr>
<td></td>
<td>• No informationals—Suppresses all informational messages, but includes errors and warnings in the log files.</td>
</tr>
<tr>
<td></td>
<td>• Some informationals—Includes some informational messages in the log files.</td>
</tr>
<tr>
<td></td>
<td>• Many informationals—Includes additional status information in the log files.</td>
</tr>
<tr>
<td></td>
<td>• All informationals—Provides maximum information. Includes all informational messages, errors, and warnings in the log files.</td>
</tr>
<tr>
<td>Report advanced statistics</td>
<td>Specifies whether to write advanced timing and deduplication statistics to the log files.</td>
</tr>
<tr>
<td>Enable debugging messages</td>
<td>Specifies whether to write maximum information to log files, which creates very large log files.</td>
</tr>
</tbody>
</table>

### Table 123 Backup plug-in options for file system traversal

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Do not traverse any mounts</td>
<td>Specifies whether to traverse mount points during the backup.</td>
</tr>
<tr>
<td>Traverse fixed-disk mounts</td>
<td>Specifies whether to traverse only hard disk file system mount during the backup.</td>
</tr>
</tbody>
</table>
### Table 123 Backup plug-in options for file system traversal (continued)

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Traverse fixed-disk and remote network mounts</td>
<td>Specifies whether to traverse both hard disk and NFS network mount points during the backup.</td>
</tr>
<tr>
<td>Force traversal of specified file system type(s)</td>
<td>Accepts a comma-separated list of one or more file system types (for example, nfs, ext2, jfs, xfs) that should not be traversed during this backup.</td>
</tr>
</tbody>
</table>

### Table 124 Backup plug-in options for pre-script

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Run user-defined script at beginning of backup</td>
<td>Runs a user-defined script at the beginning of the backup session. The script must be located in <code>/usr/local/avamar/etc/scripts</code>.</td>
</tr>
<tr>
<td>Abort backup if script fails</td>
<td>Specifies whether to stop the backup if the script returns a non-zero status code.</td>
</tr>
</tbody>
</table>

### Table 125 Backup plug-in options for post-script

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Run user-defined script at end of backup</td>
<td>Runs a user-defined script at the end of the backup session. The script must be located in <code>/usr/local/avamar/etc/scripts</code>.</td>
</tr>
<tr>
<td>Exit process with script failure exitcode</td>
<td>Specifies whether <code>avtar</code> should exit with the exit code of the script instead of a standard <code>avtar</code> exit code.</td>
</tr>
</tbody>
</table>

### Table 126 Backup plug-in client cache options

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Check client-side caches and report inconsistencies</td>
<td>If selected, a backup does not occur. Instead, Avamar performs a validation check of the client-side cache with the Avamar server.</td>
</tr>
<tr>
<td>Check and repair client-side caches</td>
<td>If selected, a backup does not occur. Instead, Avamar performs a validation check of the client-side cache with the Avamar server, and repairs inconsistencies.</td>
</tr>
<tr>
<td>Maximum client file cache size (MBs)</td>
<td>Specifies the maximum client file cache size in MB. A negative value indicates a fraction of RAM. For example, -8 specifies that no more than 1/8th of physical RAM should be allocated to the client file cache.</td>
</tr>
<tr>
<td>Maximum client hash cache size (MBs)</td>
<td>Specifies the maximum client hash cache size in MB. A negative value indicates a fraction of RAM. For example, -8 specifies that no more than 1/8th of physical RAM should be allocated to the client hash cache.</td>
</tr>
</tbody>
</table>
### Table 127 Backup plug-in advanced options

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Client-side flag file</td>
<td>Specifies the path to a flag file on the client that contains additional option settings.</td>
</tr>
<tr>
<td>Network usage throttle (Mbps)</td>
<td>Specifies a setting that reduces network usage to a specified rate, expressed as megabits/second. For example, 0 = unrestricted, 50% of a T1 = 0.72.</td>
</tr>
<tr>
<td>Directly connect to all server nodes</td>
<td>Specifies whether to establish multiple connections to the server. Multiple connections can improve backup performance.</td>
</tr>
</tbody>
</table>

### Restore options

The restore options that are available depend on the type of plug-in.

This section describes the backup options for the following plug-ins:

- AIX file system
- FreeBSD file system
- HP-UX file system
- Linux file system
- Macintosh file system
- NetWare file system
- SCO OpenServer file system

Restore options for the Avamar Plug-in for Microsoft Windows are available in the *EMC Avamar for Windows Server User Guide*. Restore options for application plug-ins, such as SQL Server and SharePoint VSS, are available in the user guide for the plug-in.

The following tables describe the options that are available when you perform a restore using the listed file system plug-ins.

### Table 128 Restore plug-in options

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Overwrite existing files</td>
<td>Controls behavior when the file to be restored exists. One of the following:</td>
</tr>
<tr>
<td></td>
<td>• Never</td>
</tr>
<tr>
<td></td>
<td>• Always</td>
</tr>
<tr>
<td></td>
<td>• Generate New Name</td>
</tr>
<tr>
<td></td>
<td>• If Modified</td>
</tr>
<tr>
<td></td>
<td>• If Newer</td>
</tr>
<tr>
<td>Encryption method from Data Domain system</td>
<td>If the backup was stored on a Data Domain system, select the encryption method to use for data transfer from the Data Domain system to the client.</td>
</tr>
</tbody>
</table>
Table 129 Restore plug-in options for (NetWare only) SMS Authentication

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Server login ID</td>
<td>(NetWare only) Specifies the SMS login username. For example, CN=admin.O=HOSTNAME_CTX.</td>
</tr>
<tr>
<td>Server password</td>
<td>(NetWare only) Specifies the password for the SMS login username.</td>
</tr>
</tbody>
</table>

Table 130 Restore plug-in options for logging

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>List backup contents</td>
<td>Specifies how much information about the backup contents to include in the log files. One of the following:</td>
</tr>
<tr>
<td></td>
<td>• No file listing</td>
</tr>
<tr>
<td></td>
<td>• List file names</td>
</tr>
<tr>
<td></td>
<td>• List files and dates</td>
</tr>
<tr>
<td>Informational</td>
<td>Specifies how many informational messages to include in the log files. One</td>
</tr>
<tr>
<td>message level</td>
<td>of the following:</td>
</tr>
<tr>
<td></td>
<td>• No informationals—Suppresses all informational messages, but includes errors and warnings in the log files.</td>
</tr>
<tr>
<td></td>
<td>• Some informationals—Includes some informational messages in the log files.</td>
</tr>
<tr>
<td></td>
<td>• Many informationals—Includes additional status information in the log files.</td>
</tr>
<tr>
<td></td>
<td>• All informationals—Provides maximum information. Includes all informational messages, errors, and warnings in the log files.</td>
</tr>
<tr>
<td>Report advanced</td>
<td>Specifies whether to write advanced timing and deduplication statistics to</td>
</tr>
<tr>
<td>statistics</td>
<td>the log files.</td>
</tr>
<tr>
<td>Enable debugging</td>
<td>Specifies whether to write maximum information to log files, which creates</td>
</tr>
<tr>
<td>messages</td>
<td>very large log files.</td>
</tr>
</tbody>
</table>

Table 131 Restore plug-in options for pre-script

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Run user-defined script at beginning of restore</td>
<td>Runs a user-defined script at the beginning of the restore session. The script must be located in /usr/local/avamar/etc/scripts.</td>
</tr>
<tr>
<td>Abort restore if script fails</td>
<td>When the script returns a non-zero status code, specifies whether to stop the restore.</td>
</tr>
</tbody>
</table>
Table 132 Restore plug-in options for post-script

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Run user-defined script at end of restore</td>
<td>Runs a user-defined script at the end of the restore session. The script must be located in /usr/local/avamar/etc/scripts.</td>
</tr>
<tr>
<td>Exit process with script failure exitcode</td>
<td>Specifies whether avtar should exit with the exit code of the script instead of a standard avtar exit code.</td>
</tr>
</tbody>
</table>

Table 133 Restore plug-in client cache options

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Check client-side caches and report inconsistencies</td>
<td>If selected, a restore does not occur. Instead, Avamar performs a validation check of the client-side cache with the Avamar server.</td>
</tr>
<tr>
<td>Check and repair client-side caches</td>
<td>If selected, a restore does not occur. Instead, Avamar performs a validation check of the client-side cache with the Avamar server, and repairs inconsistencies.</td>
</tr>
<tr>
<td>Rebuild client-side caches from most recent backup</td>
<td>Does not restore data. If selected, Avamar uses the contents of the last backup to re-create the client-side file cache.</td>
</tr>
</tbody>
</table>

Table 134 Restore plug-in advanced options

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Do not descend into subdirectories</td>
<td>Specifies whether to restore only the specified top-level directory and not any subdirectories.</td>
</tr>
<tr>
<td>Recreate original path beneath target directory</td>
<td>Specifies whether to re-create the original path to files and directories beneath the specified target directory. For example, if you restore /usr/MyDir/MyFile to /tmp and you select this option, then the full path to the restored file is /tmp/usr/MyDir/MyFile.</td>
</tr>
<tr>
<td>Directly connect to all server nodes</td>
<td>Specifies whether to establish multiple connections to the server. Multiple connections can improve restore performance under certain circumstances.</td>
</tr>
</tbody>
</table>
Plug-in Options
GLOSSARY

accelerator The Avamar NDMP Accelerator (accelerator) is a specialized Avamar server node that, when used as part of an Avamar system, enables backup and restore of network addressed storage (NAS) systems by way of the network data management protocol (NDMP).

activation The process of passing the client ID (CID) back to the client, where it is stored in an encrypted file on the client file system.

See also client activation

authentication system A username and password system that is used to grant user access to the Avamar server. Avamar supports its own internal authentication system (avs), as well as several external authentication systems (OpenLDAP, Windows Active Directory, NIS, and SMB).

Avamar Administrator A graphical management console software application that is used to remotely administer an Avamar system from a supported Windows or Linux client computer.

Avamar client A computer or workstation that runs Avamar software and accesses the Avamar server over a network connection. Avamar client software comprises a client agent and one or more plug-ins.

Avamar Downloader Service A Windows-based file distribution system that delivers software installation packages to target Avamar systems.

Avamar File System (AvFS) A browsable virtual file system view of the normally inaccessible Avamar HFS. The Avamar File System provides read-only accessibility to all backups stored on an Avamar server down to the individual file level. This allows an Avamar server to be used as an online long-term historical strategic enterprise information store in addition to a backup and restore repository.

Avamar Installation Manager A web interface that manages installation packages.

Avamar server The server component of the Avamar client/server system. Avamar server is a fault-tolerant, high-availability system that efficiently stores the backups from all protected clients. It also provides essential processes and services required for data restores, client access, and remote system administration. Avamar server runs as a distributed application across multiple networked storage nodes.

Avamar Web Access A browser-based user interface that provides access to the Avamar server for the express purpose of restoring files to a client.

AvInstaller A backend service that executes and reports package installations.
B

backup A point-in-time copy of client data that can be restored as individual files, selected data, or as an entire backup.

C

client activation The process of passing the client ID (CID) back to the client, where it is stored in an encrypted file on the client file system.

See also activation

client agent A platform-specific software process that runs on the client and communicates with the Management Console Server (MCS) and with any plug-ins installed on that client.

client registration The process of establishing an identity with the Avamar server. When Avamar recognizes the client, it assigns a unique client ID (CID), which it passes back to the client during client activation.

See also registration

ConnectEMC A program that runs on the Avamar server and that sends information to EMC Technical Support. ConnectEMC is typically configured to send alerts for high priority events as they occur, as well as reports once daily.

D

dataset A policy that defines a set of files, directories, and file systems for each supported platform that are included or excluded in backups across a group of clients. A dataset is a persistent and reusable Avamar policy that can be named and attached to multiple groups.

DNS Domain Name Server. A dynamic and distributed directory service for assigning domain names to specific IP addresses.

domain A feature in Avamar Administrator that is used to organize large numbers of clients into named areas of control and management.

E

Email Home An optional feature that uses the High Priority Events profile and Notification schedule to regularly send server error and status messages to EMC Technical Support.

EMC repository A repository that contains server installation packages, client installation packages, and manifest files. The repository is located on the EMC network. Each EMC customer has a download center that contains files available to them. Outgoing communication from the Avamar Downloader Service to the EMC repository is encrypted with SSL over an HTTP connection.

EM Tomcat server (EMT) The Avamar EM Tomcat server (EMT) provides essential services required to display Avamar system information, and provides a mechanism for managing Avamar systems using a standard web browser. The EMT also communicates directly with MCS.
ESRS  EMC Secure Remote Support.

F

full replication  A full “root-to-root” replication creates a complete logical copy of an entire source system on the destination system. The replicated data is not copied to the REPLICATE domain. Instead, it is added to the root domain just as if source clients had registered with the destination system. Also, source server data replicated in this manner is fully modifiable on the destination system. This replication method is typically used for system migration (from a smaller Avamar configuration to a larger, possibly multi-node configuration) or system replacement (for instance, in a case of disaster recovery).

G

group  A level of organization in Avamar Administrator for one or more Avamar clients. All clients in an Avamar group use the same group policies, which include the dataset, schedule, and retention policy.

group policy  The dataset, schedule, and retention policy for all clients in an Avamar group.

H

HFS  Hash File System. The content addressed storage area inside the Avamar server used to store client backups.

HFS check  An Avamar Hash File System check (HFS check) is an internal operation that validates the integrity of a specific checkpoint. Once a checkpoint has passed an HFS check, it can be considered reliable enough to be used for a server rollback.

J

JRE  Java Runtime Environment.

L

LAN  Local Area Network.

local repository  The /data01/avamar/repo/packages directory on the utility node or single-node server. This directory contains the most current manifest file from the EMC repository. The Avamar Downloader Service pushes packages from the EMC repository to the local repository. If a customer site does not allow Internet access, you can manually copy packages into the local repository.

LOFS  Loopback File System
M

**MAC address**  Media Access Control Address. A unique hardware address, typically embedded at the lowest level in a hardware assembly, that uniquely identifies each device on a network.

**manifest file**  An XML file listing all the server, client, and workflow packages currently available for download from the EMC repository.

**MCS**  Management console server. The server subsystem that provides centralized administration (scheduling, monitoring, and management) for the Avamar server. The MCS also runs the server-side processes used by *Avamar Administrator*.

**module**  Avamar 1.2.0 and earlier multi-node Avamar servers utilized a dual-module synchronous RAIN architecture in which nodes were equally distributed in two separate equipment cabinets on separate subnets. The term “module” is a logical construct used to describe and support this architecture (older multi-node Avamar servers comprised a primary module and a secondary module). These legacy systems continue to be supported. However, newer multi-node Avamar servers use a single module architecture, and even though Avamar Administrator provides “module detail” information, a module is therefore logically equivalent to the entire server.

N

**NAT**  Network Address Translation.

**NDMP**  Network data management protocol. An open protocol that is used to move data from a NAS system to a backup server.

**NFS**  Network file system.

**NIS**  Network Information Service. An external authentication system that can be used to log in to an Avamar server.

**node**  A networked storage subsystem that consists of both processing power and hard drive storage, and runs Avamar software.

**NTP**  Network Time Protocol. Controls the time synchronization of a client or server computer to another reference time source.

O

**ODBC**  Open DataBase Connectivity. A standard database access method that makes it possible to access any data from any application, regardless of which database management system (DBMS) is handling the data.

**OpenLDAP**  Open Lightweight Directory Access Protocol. An external authentication system that can be used to log in to an Avamar server.
packages  Avamar software installation files, hotfix patches, and OS patches available from the EMC repository. Packages comprise three types:

- Client—A release of Avamar file system or application backup software.
- Server—A new release of Avamar server software, a service pack, or a patch for the operating system, MC, or GSAN.
- Workflow—A package that runs operations such as adding a node or replacing a node.

Package files use the .avp file extension.

PAM  Pluggable Authentication Module. A Linux library that enables a local system administrator to define how individual applications authenticate users.

plug-in  Avamar client software that recognizes a particular kind of data resident on that client.

plug-in options  Options that you specify during backup or restore to control backup or restore functionality.

policy  A set of rules for client backups that can be named and applied to multiple groups. Groups have dataset, schedule, and retention policies.

R

RAIN  Redundant Array of Independent Nodes. A flexible, fault-tolerant architecture that enables an Avamar server to maintain availability and preserve data storage if single nodes fail in an Avamar module.

RDMS  Relational Database Management System.

registration  The process of establishing an identity with the Avamar server. When Avamar recognizes the client, it assigns a unique client ID (CID), which it passes back to the client during client activation.

See also client registration

replica  Replicated copy of a backup.

replication  Replication is an optional feature that enables an Avamar system to store read-only copies of its data on a remote system. The replicated data can be replicas of client backups and copies of Avamar system data. Replication supports disaster recovery of the Avamar system.

restore  An operation that retrieves one or more file systems, directories, files, or data objects from a backup and writes the data to a designated location.

retention  The time setting to automatically delete backups on an Avamar server. Retention can be set to permanent for backups that should not be deleted from an Avamar server. Retention is a persistent and reusable Avamar policy that can be named and attached to multiple groups.

roles  A setting in Avamar Administrator that controls which operations each user can perform in the Avamar server. Roles are assigned on a user-by-user basis.
S

**schedule** The ability to control the frequency and the start and end time each day for backups of clients in a group. A schedule is a persistent and reusable Avamar policy that can be named and attached to multiple groups.

**SSH** Secure Shell. A remote login utility that authenticates by way of encrypted security keys instead of prompting for passwords. This prevents passwords from traveling across networks in an unprotected manner.

**storage node** A node in the Avamar server that provides storage of data.

**system migration** A planned operation that uses full “root-to-root” replication to copy all data residing on a source Avamar server to a new destination server. If global client IDs (global CIDs) are used, clients that formerly backed up to the source server can continue to operate transparently without reregistering with the new destination server.

T

**TFTP** Trivial File Transfer Protocol. A version of the TCP/IP FTP protocol that has no directory or password capabilities.

U

**utility node** In scalable multi-node Avamar servers, a single utility node provides essential internal services for the server. These services include MCS, cronjob, Domain Name Server (DNS), External authentication, Network Time Protocol (NTP), and Web access. Because utility nodes are dedicated to running these essential services, they cannot be used to store backups.

V

**VLAN** Virtual Local Area Network.
